Methods of Teaching Environmental Education Facilitator’s Guide

OFFICE OF ENVIRONMENTAL EDUCATION AND PUBLIC AFFAIRS

North Carolina Department of Environmental Quality
BLANK INSIDE COVER
Special thanks to all the MOTEE facilitators, and to the following for their help on the 2017 Revision:

Heidi Dull, North Carolina State Parks
Kathryn Royal, North Carolina State Parks
D’Nise Hefner, Wake County Parks, Recreation and Open Space
Kelly Hendrix, Wake County Parks, Recreation and Open Space
Tanya Poole, North Carolina Wildlife Resources Commission
Sarah Yelton, UNC Environmental Resource Program
Benita Tipton, N.C. Department of Public Instruction Science Section

This workshop is based on the original MOTEE workshop developed in 2009 by Dr. Brad Daniel and Dr. Dorothea K. Shuman, Montreat College

Revised July 2017

State of North Carolina
Governor: Roy Cooper

North Carolina Department of Environmental Quality
Secretary: Michael S. Regan

Office of Environmental Education and Public Affairs
Lisa Tolley, Environmental Education Program Manager
Marty Wiggins, Environmental Education Program Consultant

Printed on recycled content paper
# TABLE OF CONTENTS

## Section I: Welcome and Overview
- Reading 1.1 Schedule and Goals
- Reading 1.2 What is Environmental Education?
- Worksheet 1.1 What is Environmental Education?

## Section II. Differentiated Instruction
- Reading 2.1 Diverse Learners
- Reading 2.2 Project WILD What Did Your Lunch Cost Wildlife?

## Section III. Creating the Learning Environment
- Resource 3.1 Behavior Management Role Play Descriptions
- Reading 3.1 “The 4 P’s”
- Worksheet 3.1 How Not to Teach Outdoor Education
- Reading 3.2 Teaching Tips
- Reading 3.3 Behavior Management
- Reading 3.4 Safety Considerations When Teaching Outdoors

## Section IV. Teaching Methods
- Reading 4.1 Teachable Moments and Inquiry Quotes
- Reading 4.2 The 5E Learning Cycle
- Worksheet 4.1 The 5E Learning Cycle
- Reading 4.3 Longleaf Pine Ecosystem
- Reading 4.4 The 5E Learning Cycle Example
- Reading 4.5 A Variety of Teaching Methods

## Section V. Practicing Developmentally Appropriate Education
- Reading 5.1 *Save the Elephants: Don’t Buy Ivory Soap*
- Reading 5.2 Developmentally Appropriate Practice
- Reading 5.3 Developmental Stages
- Reading 5.4 Developmental Characteristics and Interests of School-Age Children
- Resource 5.1 Know Your Learner Cards
Section VI. Assessment .................................................................................................................. 74
  Reading 6.1 Revised Bloom’s Taxonomy
  Worksheet 6.1 Writing Objectives
  Worksheet 6.2 Types of Assessment
  Worksheet 6.3 SMART Objectives
  Reading 6.3 NAAEE Guidelines for Learning

Section VII. Correlating to the North Carolina Essential Standards ........................................... 84
  Reading 7.1 A Guide to Correlating Non-formal EE Programming
  Reading 7.2 North Carolina Essential Standards: Grade 5 Science Unpacked Content

Section VIII. Reflection .................................................................................................................. 90

The online MOTEE Appendix can be found on the N.C. Office of Environmental Education and Public Affairs website. Go to www.eenorthcarolina.org, select “Find Resources” under the RESOURCES drop down menu, and search for “MOTEE” or use http://bit.ly/MOTEEAppendix. There are many supplemental resources on this page that extend the content of this workshop.
SECTION I
WELCOME AND OVERVIEW

This section will help you get to know the participants and briefly reviews basic environmental education principles. The workshop’s goals and schedule will also be introduced.

Estimated Time: 1 Hour

Introductory Activities

1. Introduce yourself, welcome participants to the workshop and provide general logistical information, (i.e., location of water fountains, restrooms, etc.) Refer them to Reading 1.1, Schedule and Goals.

2. Be sure to tell the participants that throughout this workshop you will be modeling a variety of teaching methods and techniques. Mention that even here in the introduction, you are modeling “creating the learning environment” by:
   a. Introducing yourself and covering logistics.
   b. Setting your workshop (or classroom) expectations.
   c. Having participants introduce themselves.
   d. Reviewing the outline of the course and the learning goals.

3. Ask the participants to introduce themselves and to briefly state what organization they are with, if any, and their role as an educator.

4. ICEBREAKER- Use an icebreaker that really gets participants interacting and finding common ground. The more comfortable they are with each other, the livelier the discussions will be later on. You may want to do the icebreaker outside to reduce the amount of time indoors and increase the activity level of the participants. “Forced Choice” is just a suggested icebreaker--feel free to use your favorite. The MOTEE online appendix has other icebreaker ideas.

   Forced Choice Icebreaker: Participants will choose a side of the room based on their answers to questions. The questions can be controversial but must be non-threatening. They can either choose between one or the other or you can ask questions and have them form a spectrum of strongly disagree to strongly agree. After each question ask them to introduce themselves to their neighbor and discuss their commonality.
Tell participants that depending on the questions and the number of answer choices, this can be used to create random student groups as well. Here are some questions to get you started:

- Did you drive less than 50 miles to come to the workshop or more than 50 miles?
- Do you prefer chocolate ice cream or vanilla ice cream or neither?
- Arrange yourselves by the number of years of experience you have as an environmental educator.
- Do you prefer a PC or a Mac?
- When you travel would you rather visit cities or rural areas?
- Are you more like a Cheetah or a two-toed Sloth?
- Are you from North Carolina or somewhere else?
- Do you prefer mammals, reptiles, amphibians, birds, fish or invertebrates?
- Would you rather teach early childhood, elementary, adolescents, or adults?

5. **Schedule Review**: Briefly review workshop schedule and goals, *Reading 1.1*

6. **Lesson Plans**: Tell participants that throughout the workshop, they will work in groups or pairs to develop an environmental education lesson plan. It will be used for practice in writing objectives, developing age-appropriate activities, demonstrating different teaching methods and correlating to the N.C. Essential Standards.

7. **What is Environmental Education?**
   a. Ask participants to answer question 1 about what environmental education means to them, *Worksheet 1.1*. It may be best if they cover or do not look at questions 2 and 3.
   b. After they have finished, explain that this question could be debated for hours, but it is important to have a cohesive definition that is widely accepted.
   c. Review *Reading 1.2* with the participants. These are based on the accepted definitions of environmental education by the U.S. EPA, the North American Association for Environmental Education and the N.C. Office of Environmental Education and Public Affairs. More information, definitions and research on the concept of environmental education is on the N.C. Office of Environmental Education and Public Affairs website and on the MOTEE online appendix.
   d. Have the participants answer questions 2 and 3. It is essential that participants understand the distinction between environmental education and environmental advocacy as well as the other basic components of EE. This could be a lengthy discussion, so you may need to curtail discussion by telling participants they will have another opportunity to discuss their questions during the final closing session.

You may want to use the **Think, Pair, Share Technique** here to facilitate the discussion on environmental education:
Propose a question to the group. Give participants a moment to answer the question individually. Then, ask the participants to get in pairs or small groups and share their responses. Ask the pairs or small groups to share their responses with the whole group.
READING 1.1 – Schedule and Goals

Schedule

I. Welcome and Overview
II. Differentiated Instruction
III. Creating the Learning Environment
IV. Teaching Methods
V. Practicing Developmentally Appropriate Education
VI. Closing the Loop of Learning: Assessment
VII. North Carolina Essential Standards
VIII. Reflection

Methods of Teaching EE Workshop Goals

1. Understand the needs and backgrounds of diverse learners to create an inclusive learning experience.

2. Gain skills and resources for managing groups, creating the learning environment and dealing effectively with safety issues.

3. Introduce inquiry and other teaching methods to meet a variety of learning styles and to guide the development of lesson planning.

4. Explore age-appropriate concepts and programming/lessons (pre-k through adult).

5. Gain skills in writing program and lesson objectives and introduce basic assessment strategies.

6. Introduce the N.C. Essential Standards and learn how to incorporate them into EE programming.
READING 1.2 -
What is Environmental Education?

In the classroom and beyond, the desired outcome of environmental education (EE) is environmental literacy. To that end, environmental education strives to increase public awareness and knowledge of the environment and to provide the skills necessary to make informed environmental decisions and take responsible actions. EE does not advocate a particular viewpoint, but rather provides a context for learning in which the learner can develop a deeper connection to nature and develop the problem-solving skills to address various environmental issues.

Environmental education (EE) teaches children and adults how to learn about and investigate their environment, and to make intelligent, informed decisions about how they can take care of it. (NAAEE, What is Environmental Education?)

Environmental education does not advocate a particular viewpoint or course of action. Rather, environmental education teaches individuals how to weigh various sides of an issue through critical thinking and it enhances their own problem-solving and decision-making skills. (U.S. EPA, Environmental Education and Literacy)

Components of Environmental Education

The U.S. Environmental Protection Agency defines the components of environmental education as follows:

- Awareness and sensitivity to the environment and environmental challenges
- Knowledge and understanding of the environment and environmental challenges
- Attitudes of concern for the environment and motivation to improve or maintain environmental quality
- Skills to identify and help resolve environmental challenges
- Participation in activities that lead to the resolution of environmental challenges

The Southeast Environmental Education Alliance places the components of environmental education into a continuum representing the learning process:
WORKSHEET 1.1 -
What is Environmental Education?

1. In your own words, before reading any further, write 2-3 sentences describing what environmental education means to you.

2. After you and the facilitator review Reading 1.2, What is Environmental Education?, reflect on an experience you have had either teaching an environmental issue or being taught an environmental issue. Do you feel this issue was taught in a fair and unbiased manner? Why or why not?

3. Why do you think it is important to teach facts rather than opinions or values? Can you think of an issue in which this may be difficult and how you might approach it?
SECTION II
DIFFERENTIATED INSTRUCTION

In many situations, environmental educators are tasked with teaching diverse groups of individuals who they have just met for the first time. It may be a walk-up program at a park, zoo, museum or nature center; a school group visiting your site for the first time or your first visit to a senior center as part of an outreach program. And even in school groups or programs for adults--where there is more uniformity in age--participants still bring a variety of skills, experiences and knowledge to the program or activity. What is an environmental educator to do?!

Activity 1: Learning to Tie Your Shoelaces

1. Print the Station Directions provided at the end of this section (Stations 1-4, before Reading 2.1). Set up 4 stations with shoes with laces and the Station directions. You may want to tape the Station Directions to the table or desk. One station will need a computer to watch the video.

2. Get participants into groups by their favorite type of snack: salty, fruity, chocolatey, liquid (or your favorite grouping method).

3. Participants should work through each station with their teammates. The order doesn’t matter.

4. After working through all stations, which should take about 25-30 minutes, participants should rank each station 1-4. 1 is their least favorite way to learn to tie their shoelace and 4 is their most favorite way to learn to tie their shoelace.

5. Regroup everyone by their favorite method and have them discuss why it was their favorite. Also, discuss what is their least favorite method and why.

6. Facilitate an entire group discussion: What does this say about how we learn? You will want to highlight that we all learn differently depending on the skill, the time of day, the mood we are in, our prior experiences, etc.
Discussion: Our shoe tying activity is a simple and fun example of “differentiated learning” (DI). The strategies of DI can help environmental educators better meet the needs of all learners and participants in programs. DI advocate Dr. Carol Anne Tomlinson has noted that DI means giving students multiple options for taking in information—taking varied approaches to what students need to learn, how they will learn it, and how you (the instructor) assesses what they have learned.

As educators, we want to make sure we are varying the teaching methods we use in our programs. An example might be starting a program for kindergarteners with a short discussion on black bears and what they eat. Then, take the students outside to go on a search for wild foods they think a bear might like to eat. They can practice walking and sounding like a bear while they search. Next, bring students back inside to draw pictures of a black bear and some of the foods they like to eat. Wrap up the program by reading aloud Bear Wants More by Karma Wilson.

A good rule of thumb with any program—especially if you will be with the group for an extended time—is to plan environmental education activities so program participants are receiving a variety of instructional methods that utilize as many of the students’ five senses as possible. Using a variety of hands-on activities and different forms of media is more likely to engage learners and motivate them to want to learn more. Another approach is to teach as a good scientist would do research—engage students in a variety of learning practices and methods that encourages them to explore their surroundings and test their hypotheses in a variety of ways. There’s nothing wrong with a bit of lecture or “walk and talk” if other learning activities are incorporated into your programs, workshops and camps.

Summarizing Group Discussion for Activity 1: In small groups (or as a whole group discussion) have participants read the Project WILD activity What Did Your Lunch Cost Wildlife? and ask them to briefly share ways this lesson could be taught that would incorporate more than one instructional method. What are different ways to teach this lesson that would engage learners and elicit prior knowledge and experiences?
Activity 2: Teaching Inclusively with What Did Your Lunch Cost Wildlife?

Differentiated Instruction goes beyond incorporating a variety of teaching methods into lessons. Students’ cultural backgrounds and socio-economic status can also influence how lesson content is perceived and learned. (Point out Maslow’s Hierarchy of Needs, Reading 3.5) Maslow’s Hierarchy of Needs should also be considered when designing and presenting a lesson. Participants bring many different experiences and needs to the educational setting, and we must be aware that their focus is sometimes on their physiological, safety, belonging and esteem needs rather than their drive to learn new concepts and information.

1. Read Understanding Young Children: Diverse Learners on Reading 2.1. Ask the group if they have any questions or anything they want to discuss.

2. Reading 2.2., What Did Your Lunch Cost Wildlife? is an excellent activity about our food systems, consumer choice and impacts to wildlife and the environment. MOTEE participants will use it as an example of why environmental educators need to be sensitive to diverse audiences.

3. Ask participants to review Reading 2.2. and use Think, Pair, Share or small groups to discuss some of the cultural, ethical or social issues that could arise when using this activity with diverse audiences. After they share, use the following prompts if topics are not addressed through group discussion. You may also want to use Worksheet 2.2 to facilitate discussion.

Discussion Prompts for What Did Your Lunch Cost Wildlife? Activity:

- Could using participant lunches as an example bring up different issues pertaining to diverse learners? (income level, cultural foods, parents’ occupations, ethical issues)

- How could an effective environmental educator still do this activity with various groups and individuals and incorporate these issues in the planning and presenting of the lesson?

- What are some various strategies for being sensitive to diversity that could be employed in this lesson?

- Discuss the various controversial issues that could be covered with this lesson. Why is it important to know your audience when doing lessons on environmental issues?

- Remind the participants about teaching issues (John Hug – Two Hats). What are some environmental issues addressed by this activity?

- How could an environmental educator manage the various issues addressed in this activity in a balanced manner?

Station 1

How to Tie Your Shoe

Compare the two descriptions on learning to tie your shoelaces. Which way makes the most sense to you?

Method A:

1. Fold each end of the lace into a single “bunny ear.” You can hold the “ears” in place between your thumb and pointer finger on each hand.

2. Cross the bunny ears so that they form an “X” in the air.

3. Loop the bottom bunny ear over and through the top bunny ear. This will create a second knot.

4. Pull the bunny ears out to the side away from the shoe. This will create a square knot that will not easily come undone and will hold the shoe in place.

Method B:

1. Take one lace in each hand and make an X. Draw the top lace through the bottom of the X and pull the two laces tight. Then make a loop out of each lace.

2. Cross the bunny ears over each other. Cross one “ear” over the other, in the opposite order of your overhand knot.

3. Run the bunny ears over each other. Make “the bunny run around the tree” by bending one loop over the other.

4. See the bunny jump in a hole. Now “the bunny sees a dog and jumps in the hole”: Pass the tip of the bent ear through the hole.

5. Pull loops tight. For extra security, you can double the knot by making another overhand knot with the loops.

Station 2

Learning to Tie Your Shoelaces Through Song

Join in with Savion and Elmo to learn a shoe-tying song! Find a partner and a pair of shoes with laces and practice tying your shoe while you learn the shoe-tying song.

https://youtu.be/USmG6s2tbkU
Station 3

Mission Possible: To Keep Your Shoes From Coming Off

Your mission is to figure out how to keep your shoes with shoe laces from coming off your feet when you run around.

You have a pair of shoes to work with. You can even use your own. Work together with your teammates to figure out how to tie the laces so that you can run fast uphill or downhill, and climb trees without your shoes slipping off your feet or you tripping on dangling laces.

Mission Completed? Make sure each person on your team knows the process well enough that they can explain it to someone who doesn’t know how to use your method.
Station 4

Shoe Tying Demonstration

One member of your group is an expert shoe-tier. (I know! Mind blow, right?!)

The expert’s job is to first, demonstrate how to tie a shoe while everyone watches.

Next, the expert will slowly work through the steps again, allowing each member of the group to practice alongside of the expert.

It might be helpful for the expert to face the same direction as the teammates. The expert should repeat the steps over and over while teammates switch up who is sitting beside the expert. Teammates can help each other out, too.

Take turns demonstrating your successful shoe tying!
What does it mean?
In order to create the best possible experience for children, diversity can and should be addressed and planned for. Diversity includes race, language, socio-economic status, disability and even learning style. A quality program will take these areas of diversity into account and will make every effort to address them sensitively.

Programs that strive to create an environment and curriculum that is inclusive go beyond the surface level of “political correctness” and understand that it is in all children’s best interest to be provided with a larger, more accurate picture of the world.

This means being aware that all students are not coming from homogenous backgrounds with the same base of knowledge. It means making a genuine effort to create programs that connect familiar things to children.

Educator Emily Styles of the Seeking Education, Equity and Diversity (SEED) project encourages teachers to develop experiences for students that create both windows and mirrors.

Mirrors are opportunities for children to see their own experiences reflected. Windows allow them to see the experiences of others. Activities or experiences that may be a window for one child could be a mirror for another. If children do not see themselves in an educational experience, they are less likely to retain the information.

Connecting learning that occurs in your programs to children’s home and community experiences is respectful and sets a foundation for learning.

Why is it important?
The United States’ population is becoming increasingly diverse. Some of the most obvious and quantifiable changes are happening in the racial make up of our nation. The Bureau of Educational Statistics predicts that by 2030, children of color will make up over half of the students in U.S. schools. A Children of 2010 report published in the Los Angeles Times (March 1999) predicted that by 2050 no single ethnic group will constitute a majority of the U.S population. These statistics have enormous significance for all educators. If the goal of an environmental education program is to create a positive connection between children and the environment, not taking diverse factors into account can sabotage the goal.

What are the benefits of diverse learning?

Providing experiences that children can connect to prior knowledge increases their learning.

We know from research in educational psychology and brain function that children learn new things based on what is already established. New knowledge is categorized into what already makes sense. Learning that is isolated from what is familiar or known is less likely to be long term.

Early childhood pioneer Lev Vygotsky stated the idea of socio-cultural development, in which learning and psychological development occur through experiences that happen in a social and cultural context. Although this is now a widely accepted concept, many educators overlook the experience of a student that may be different from their own experiences. By making an extra effort to provide an inclusive experience, the learning becomes more meaningful for all students.
Why don’t educators take diversity into account more often?

*Educators may see multicultural education as a separate field from environmental education.*

This couldn’t be farther from the truth. The future of our planet is a concern for all people and learning to make connections with the natural world is crucial for all people to ensure its survival.

*Educators think that a great deal of background knowledge is needed.*

While there is a wealth of information about diverse populations and about how to work most effectively with diversity, the most important piece is awareness. Educators who are aware that diversity exists and who make an effort to be inclusive are taking an essential first step.

*Educators feel uncomfortable talking about diversity.*

Young children are aware of differences in people. When these differences are ignored or overlooked, they get the message there is something wrong with the differences. The more that human diversity is discussed and celebrated, the more children will understand and feel comfortable with the diversity around them. Educators think taking diversity into account is only necessary if there is a noticeably diverse group.

Inclusive education is the best practice no matter what the group. A child in summer camp may be in a much more homogeneous group during summer than she is in her public school during the rest of the year.

What does representing diversity look like?

*Represent reality and avoid stereotypes.*

Books and materials used (posters, photographs, music, props and so forth) should show a diverse group of people. Addressing diversity does not mean that every program and every project has to have a specific cultural focus, but the underlying message must be one of inclusion.

*Varying levels of comfort and knowledge are accepted.*

For example, a child living in an apartment building may have had minimal contact with the world outside of his or her apartment. Venturing out into a nonurban area might be frightening. Another child from the same building may have no fears of the same area.

Inclusive instructors provide a variety of ways to participate and value all kinds of knowledge.

*Welcome diversity.*

Educators should find out as much as possible about the children attending a program and adapt accordingly. This could be as simple as learning some common Hmong pronunciations of children’s names or giving a welcome greeting in one of the children’s home languages.
REACTING 2.2 -  
Project WILD Activity 

What Did Your Lunch Cost Wildlife?

Objectives
Students will (1) trace some foods from their source to the consumer; (2) identify the impact those foods and their processing have on wildlife and the environment in general; and (3) recommend, with explanations, some food habits that could benefit wildlife and the rest of the environment.

Method
Students trace food sources, diagram environmental impacts, and apply the knowledge they gain by making changes in some of their consumer choices.

Materials
Writing and drawing materials

Background
Lifestyle choices made each day have some impact on wildlife and the environment. Many of those impacts are indirect and are, therefore, less obvious. The types of food people eat each day, for example, have many implications for wildlife and the environment.

The places and ways in which foods are grown have impact. Research has indicated that loss of habitat is one of the most critical problems facing wildlife. Habitat may be lost to agricultural use or development as well as to industrial, commercial, and residential uses. Given that people need food, the ways in which food is grown—and the ways that the land is cared for in the process—are very important. Eroded soil is a major nonpoint source pollution in the United States. This lost sediment can be detrimental to aquatic and terrestrial habitats. Farmers take measures to maintain and improve wildlife habitat as they grow and harvest their crops. They also pay close attention to the impact of their growing practices. Both inorganic and organic fertilizers commonly are used in industrial agriculture. These compounds may runoff or leach into water supplies. In lakes, for example, this run-off may increase nutrients that make algae grow.

The food transportation, processing, packaging, and marketing industries also are involved. Questions about the natural resources involved in getting the food from its source of origin to the consumer are critically important. One example is increased exploration for and development of fossil fuels used to transport the food from growing site to consumer, used often to fuel the processing, and frequently used in the packaging, as in the case of fossil-fuel-derived plastics.

Ethical considerations can also be raised concerning the impact on individual animals and plants by the methods used to produce food for people, as well as choices of which foods to eat.

Grade Level: 5–8
Subject Areas: Social Studies, Language Arts, Science, Environmental Education
Duration: one to three 45-minute sessions
Group Size: any
Setting: indoors
Conceptual Framework Topic Reference: HNIIA2
Key Terms: organic, inorganic, source, renewable, nonrenewable, impact
Appendices: Taking Action
READING 2.2 - continued
Project WILD Activity

Procedure

1. Select a food item. Identify the item’s ingredients. In a discussion with students, trace the item’s ingredients all the way back to their origins. Include where and how they grew or were formed and how they were harvested, processed, transported, packaged, and made available to the consumer.

2. Ask students to generate a list of foods they either brought or bought for lunch. Be sure to include any packaging materials the foods came in.

3. Ask each student to pick one food to trace all the way back to its origins, including where and how it grew and how it was harvested, processed, transported, packaged, and made available to the consumer—the student. Ask students to make simple flow diagrams of the path the food takes. (Students may want to do some research to obtain some additional information.)

4. Next, ask students to create a picture, diagram, or chart to illustrate how food transportation affects wildlife and the environment.

5. Ask students to report—using the diagrams as a visual aid as they describe the path taken by their food and its effects on wildlife and the environment along the way.

6. Ask students to discuss and summarize their findings.

7. Ask students to think of changes they could make in their own lunch-time eating habits that would be likely to have a beneficial—or at least less harmful—effect on wildlife and the environment. Describe the reasoning for this change, and evaluate its consequences. If, after examination, each change seems to be helpful, suggest that students try making their changes for a week. At the end of the week, ask students to report. Were they able to stick with the change? What happened? If they didn’t make the change, why not? Did they forget? If they did make the change, did they find themselves making or thinking about any other possible changes? If yes, what were they?

Technology Connections

- Use the Internet to research the route of a particular food back to its origins, including where and how it grew and how it was harvested, processed, transported, packaged, and made available to the consumer. (See page 532 for a link to information on maximizing web searches.)
- Use the Internet to research how food production and/or transport affects wildlife and the environment.

Extensions

1. Map the energy used to grow and transport the food to the consumer.

2. Include the impact on other specified natural resources along the way.

3. Distinguish between renewable and nonrenewable resources.

4. Research genetically modified organisms (GMOs) and their impact on agricultural practices such as pesticide, fertilizer, and irrigation use. Debate the “pros” and “cons” of GMOs.

Aquatic Extension

Conduct this activity again asking the question, “What Did Your Lunch Cost Aquatic Wildlife?” Think of whole populations of species of aquatic animals and aquatic habitats.

Evaluation

1. Trace the possible route that a container of milk might take back to its probable source. What effect does this journey have on wildlife?

2. Identify three food habits that could reduce or increase effects on wildlife and the environment. Explain the reasoning behind your suggestions.

SECTION III
CREATING THE LEARNING ENVIRONMENT

This section is about setting the tone for the learning experience through group management, safety and common teaching tips. First you will cover the “4 Ps” of creating a positive learning environment and will apply them to a humorous outdoor teaching mistakes video. Participants will then do a teaching tips activity. Finally, you will have participants interact in a group management skit, preferably outdoors.

Materials Needed:
Laptop with internet connection and a projector or a TV and DVD player along with a copy of “How not to teach outdoor education”; easel or butcher paper; index cards for role playing scenarios; additional props of facilitator’s choice for leading the nature hike. The Outdoor Teaching Mistakes video is also available online: http://vimeo.com/33290984

Estimated Time: 1 Hour

The 4 P’s of Creating a Positive Learning Environment:
Common Teaching Mistakes Activity

1. Show the DVD/video of *How Not to Teach Outdoor Education*. In this video, Dr. Brad Daniel plays the role of a very unprepared professor who is out of touch with student needs. It may be fun to tell participants that they will be seeing an example of a master outdoor teacher to see how long it takes them to catch on to the joke. After the video, explain that the students in the video were totally unaware that this was a set-up. Only one person, Brad’s teaching assistant, was aware. She can be seen asking the most questions during the session.

2. Instruct the participants to use *Worksheet 3.1* to write down all of the mistakes that they remember from the presentation. You may want to allow them to briefly share some of the mistakes they noticed with the group.

3. Have participants review *Reading 3.1* that explains the 4 P’s and tell them to think of the 4 P’s in light of the video.
4. Next, divide the participants into four groups and assign one of the 4 P’s to each group. Each group will need one volunteer to record their discussion and one or more volunteers to present it. Give each group a large sheet of easel paper to record all the ways in which Dr. Daniel did not create a positive learning environment according to their “P.” For each mistake that they record, they must also record a solution for that mistake. Recommend that participants review Reading 3.2, Teaching Tips, for ideas on solutions. After the groups are finished, have each present what they found.

5. After they have presented, ask the participants if they have heard of, or if this activity reminds them of, Maslow’s Hierarchy of Needs. If they are not familiar, direct them to Reading 3.5. Note that Maslow believed an individual could not advance to the next level of development if the previous level had not been met. Emphasize that as effective environmental educators, we need to be aware of our audience’s basic needs first. This is especially true if the students or participants are outdoors, away from home for the first time, in an unfamiliar place, etc.

![Maslow's Hierarchy of Needs Diagram]

**Self-Actualization**  
(Achieving individual potential)

**Esteem**  
(Self-esteem and esteem from others)

**Belonging**  
(Love, affection, being a part of groups)

**Safety**  
(Shelter, removal from danger)

**Physiological**  
(Health, food and sleep)

**Note:** You can use different strategies to assign groups. You can go around the room and assign each person a number 1-4, one of four colors, one of four animals etc. You could create your own cards that have four different symbols. You could have them get into groups based on their birthday, winter, spring, summer and fall. Ask participants to share any different strategies they have for assigning groups. In most situations, you will want to assign random groups to separate groups of friends and so shy members of the class don’t get left out.

**Note:** While the groups are presenting, try demonstrating the concept of the “Look Off.” Montreat College’s Dr. Brad Daniel does this to make the whole group feel part of the discussion and it also prevents one person from dominating the group. While one member is answering a question or presenting, the instructor glances around to others in the group, briefly making eye contact. This helps other students feel they are part of the discussion. Often this will encourage the group member that is speaking to also make eye contact with others, rather than only having a one-way discussion with the instructor.
Teaching Tips Activity: Verbal Cue, Listen and Participate

1. Instruct the participants to select a “teaching tip” from a hat or cup, until they are all handed out. You should prepare the teaching tips by cutting the list of tips (from Reading 3.2) into small pieces. Each tip is titled with one or more keywords. Tell participants to read their tip (give them 2 minutes) and to be prepared to describe it in their own words when cued to do so.

2. Form a circle and instruct the participants to listen for the key word or phrase in the title of their tip. You, as facilitator, will guide the discussion by mentioning keywords for one tip at a time from the list below. When one tip is mentioned, the participant who has the tip will join the conversation and share information about his or her tip. The discussion will be free flowing. As leader, try to tie the tips together using narrative as illustrated below. Encourage the participants to play off of each other in creative ways and have fun with it.

• Consider Safety and Comfort First
• Communication is Key
• Attitude is Everything
• Give Feedback
• Get Students Involved
• Empathize with the Students/Participants
• Use a Variety of Teaching Methods
• Utilize Teachable Moments
• Be Organized but Flexible
• Humor
• Know your Subject
• Be Yourself
• Teach the Student, not the Subject
• Read the Group, not the Text
• Be Willing to Take Risks

Use this example of the threaded discussion based on the list above. Although the tips can be done in any order, always try to tie the previous comment to the next cue when possible. Have fun with it!

Facilitator: *I dislike lessons that seem to be based on just a series of loosely related topics. It seems like the best lessons come full circle (Set the Loop of Learning in Motion)...*

Facilitator: *Okay so as we set the loop in motion, it seems that we should consider first things first. What types of things should this include? (Consider Safety and Comfort First)...*

Facilitator: *Safety first seems very important as long as that gets communicated clearly to the group. Communication seems key (Communication is Key)...*

Facilitator: *I appreciate how enthusiastic you are about the importance of clear communication. What a great attitude! (Attitude is Everything)...*
Facilitator: You really articulated well the importance of having a good attitude when teaching. I just wanted to give you that feedback because feedback is so important to the learning process (Give Feedback)...

Facilitator: Wow, feedback really helps students learn more from the experience. It also encourages them to get involved in the activities (Get Students Involved)...

Facilitator: Of course, some students might have reasons for being a bit reluctant to get involved. As teachers, it seems important to try to empathize with our students by putting ourselves in their shoes (Empathize with the Students/Participants)...

Facilitator: Of course, one way to encourage students to get involved is to use a variety of teaching methods in hopes of meeting the variety of learning styles represented in the group (Use a Variety of Teaching Methods)...

Facilitator: Then, of course, there are those magical teachable moments when something presents itself such as a bird or moose (Utilize Teachable Moments)...

Facilitator: It sounds like teachable moments can be as important as the lesson plan. I guess we should try to strike a balance between being organized and being flexible (Be Organized but Flexible)...

Facilitator: I appreciate a group that can laugh together, and it makes me wonder about the role of humor in the learning process (Humor)...

Facilitator: Sometimes, I hear that some environmental educators know a lot about teaching, but they don’t really know their subject very well. Is this important? (Know Your Subject)...

Facilitator: Some of my own teachers seemed to step into a “role” when they were teaching, as if it was a performance. They were very different when I talked with them between classes. Should you be yourself or look at teaching as a performance? (Be Yourself)...

Facilitator: It sounds like being yourself also involves focusing on teaching the student, not the subject. What is the difference? (Teach the Student, not the Subject)...

Facilitator: If our focus is on student learning, it seems that we should pay attention to reading the group instead of just reading the text. (Read the Group, not the Text)...

Facilitator: You know, in many ways it is a lot easier just to lecture or read from the text, but, if we really want to grow as teachers, we have to be willing to take some risks ourselves as we ask our students to do the same (Be Willing to Take Risks)...

Group Management and Safety Activity

1. This section of the workshop may inspire a lot of group discussion and questions. Allow for this and encourage participants to share their own experiences and fears as you move through the section. Learning from each other may be more meaningful than any reading they can do on the subject.
Note: Tell participants that often the best way to learn about group management is to observe seasoned educators in the field. Most educators would be happy to allow observations if contacted and set up beforehand. This would also be a great way to network!

2. Stress to participants that preventing misbehavior is better than dealing with misbehavior, so it is very important to set clear expectations right off the bat. Review Reading 3.3 and have participants share and record other advice from personal experience.

3. At this point, you will address safety and group management through a role playing activity outdoors. To prepare, you must first choose an outdoor site before the workshop. If you choose, you can plant some hazards or you can just assess the space as is with the participants. You will also need to assign roles to some of the participants before going out. You will need to copy the Facilitator Resource 3.1 and cut the descriptions into strips, gluing them to notecards if you wish. If you do not have access to an outdoor site, you can review Reading 3.4 with them and hold a discussion for participants to share any experiences that they have had with safety. It is possible to improvise the role playing game indoors.

a. Tell participants that you will be going outside for an outdoor activity. The activity has two components. An instructor (you, the workshop facilitator) will be conducting a lesson on safety hazards in the outdoors. The participants will be acting as a group of students and assessing for possible safety hazards on the site.

b. Five participants in the group will be assigned scenarios to act out. They will act them out one at a time throughout the lesson and the group will pause to discuss the best way to respond to each scenario. Copy and separate the scenario descriptions and give one to each of the five volunteers. Between each scenario, the group will discuss how best to respond. Assign each of the student roles below to a different member of the group.

c. Take the group outside and gather them in a very sunny spot (you may need to improvise if it is not a sunny day). Begin reading Reading 3.3, Behavior Management to them. After reading a couple of bullet points, ask them if there is a better spot they could be standing. Remind them to think about the comfort of the group and that a shadier spot would be better. Explain that you are going to take a walk about the site to assess it for safety hazards according to the worksheet and that you need everyone to stay together as a group.

d. Start the walk and have each volunteer act out their respective roles in order. After each scenario, discuss ways of dealing with the scenario. REMEMBER: It is better to prevent behavior than manage it. Focus the discussion on how to prevent the behavior. After the discussion of the scenario, you can resume the lesson on safety hazards at the site. Save a couple of your talking points from Reading 3.3 to conduct while you are on the trail or walking around the site.

e. After all scenarios have been completed and participants feel they have fully assessed the site, you can wrap it up and head back to the classroom. Remind them that the online appendix has two excellent documents from N.C. State Parks that may be helpful: Steps in Preparing and Leading Nature Hikes and Do’s and Don’ts of Interpretation.
Facilitator Resource 3.1

You will need to copy this page and separate it into five strips to provide to the participant volunteers.

1. **Child Who Lags Behind** - You will be playing the role of a small child that is having a bad day and continually lags behind the group. You will do this after the instructor first gathers the students together and the group begins to walk around the site. (Possible responses: Learn about the students before they arrive. Always have an adult near the child to engage him/her. Assign the child a role such as line leader or equipment handler. Have a worksheet that goes along with the activity to keep students focused.)

2. **Talker** - You will be playing the role of a participant who likes to talk and giggle to his/her friends while the instructor is talking. You will do this after the group has discussed the runner and the facilitator begins the lesson again. (Possible responses: Stand near the talker. Warn students that you will be asking them questions to check for understanding and you expect them to be listening. Pull the student aside to address the situation if it does not get better.)

3. **Teachable Moment** - You will play the role of a student who finds something interesting on the trail that doesn’t have anything to do with what the lesson is about. You will act this out after the discussion about the talker. (Possible responses: The instructor should take the time out of the lesson to address this. It is called a teachable moment. It is exciting when students are interested in the outdoors and this should be fostered to a reasonable extent.)

4. **Flip flops** - You will play the role of a participant whose flip flops make you trip or stump your toes and you complain about being bitten by mosquitoes on your ankles. You will act this out after the lesson resumes from the discussion about the teachable moment. (Possible responses: Instructors need to decide from the beginning if they would allow this person to participate. Consider having rubber boots in a few different sizes so a student doesn’t have to sit out.)

5. **Afraid of Snakes** - You will play the role of a participant who is unreasonably afraid of snakes. You will think you see a snake everywhere, and will constantly ask if there are any copperheads, rattlesnakes, etc. in this area. You will act this out after the lesson resumes from discussing flip flops. You actually do see a small rough green snake and totally freak out. (Possible Responses: Calmly address snakes before the hike begins, educating the students on the snakes that are usually seen in the area, and what to do if they encounter a snake. Use safety measures such as boots to prevent injuries. Have an adult or co-leader of the hike stay near the student to reassure them.)
READING 3.1 -
the 4 “P’s”

**Presenter**

You will teach based on who you are and what your learning style is like. Your passion, enthusiasm, knowledge and skills all help to set the stage for learning. You have a BIG responsibility for safety, both emotionally and physically for your students, as well as for the cognitive learning that happens. Take time to think about YOUR strengths and weaknesses before you teach and ask for help if you need it. Your role is the **motivator**. If you are not motivated, your students won’t be either.

1. Set the stage for **exciting learning opportunities**. Guide students to learn through personal discovery.
2. Plan ahead so you will be ready for **facilitating learning**, not just lecturing.
3. **Prepare**, but allow room for spontaneity, based on YOUR strengths.

**Pupils**

Each student will bring a unique set of interests, motivations and expectations to your lesson. Your task is to relate to them at their level. It is important that you build rapport with your students as soon as you meet them. Learn their names, find out a little about who they are and what they are expecting. This will give you a chance to connect with them as you teach.

1. **GAMEFACE** before they come. If possible find out their G - gender, A - age, M - medical conditions, E - experience, F - familiarity with each other, A - abilities, C – culture and E - ethnicity before they come.
2. Use the students’ names and directly involve them . . . “John, feels this. Sue, what do you feel?”
3. Keep the comfort level and needs of your students in mind at all times, ex. If they are cold, get them warm. No learning will happen if basic needs are not taken care of.
4. Pull students in at the beginning of your lesson, by starting with an attention grabber, something that excites them, or sets them up for learning.
5. Set up direct experiences for learning. Example: If you are trying to learn differences in tree bark, be sure to have them touch it or make a rubbing of the bark.
6. Challenge and encourage students by using incentives and expecting success. Students like to feel good about what they are doing.
**Process**

You are in charge of the time that the students are in your class; in essence, you are in the driver’s seat choosing the route. In general, begin strong, take charge (without being overbearing), focus on enjoyment and learning, and conclude well. Have a plan and follow it!

1. **Use advanced organizers.** Describe what the students can expect. Example: There are three things that I want you to know about our time together.
2. **Relate to the audience.** Use analogies to connect ideas and concepts to the students’ world.
3. **Connect experiences, weave them together.** Refer back to any experience that you have had at an earlier time with the group. Example: Compare forest smells and sounds to field smells and sounds as they move from one environment to the other.
4. **Use the teachable moment** when you have encountered something of interest, stop and look.
5. **Use the sensory approach** when appropriate.
6. **Manage students’ needs.**
   a. Establish expectations and guidelines for behavior.
   b. Set expectations, alleviate anxiety.
   c. Reward and acknowledge acceptable behavior.
7. **Ask good questions.** Encourage higher levels of thinking, ask open-ended instead of closed-ended questions. Use the Socratic Method.

**Place**

Determine what your classroom environment will be. Is it best to teach this lesson inside or outside? If outside, have you visited the spot before? Do you know where you are going? Is it safe? If inside, do you have the space you will need? Can you move tables and chairs?

1. Determine any **learning barriers**, before you begin – sounds, sun, wind, temperature extremes, water, etc.
2. Be sure to bring all the **teaching aids** that you need, whether blindfolds, a small white board, field guides, binoculars, specimens, first aid kit, etc.
3. **Keep safety in mind**, set boundaries if needed.
4. If outside – the **environment is everything** – use it, don’t just talk about it, or play in it, EXPLORE it!!

*Adapted from: Gilbertson, K; Bates, T.; McLaughlin, T; and Ewert, A. (2005). *Outdoor Education, Methods and Strategies.*
1. Make a comprehensive list of the mistakes you see in the lesson. Later, in a group, you will think of solutions to the mistakes you observed.

**READING 3.2 - Teaching Tips**

**Consider Safety and Comfort First**

Safety should always take priority over “success.” Consider weather conditions, physical abilities, sunlight, distractions, etc. Be sure to keep them well fed, hydrated, warm or cool (depending on season), etc. Try to discreetly determine if your participants have any allergies that you need to be aware of before they arrive. Discuss any safety issues they will need to be aware of before starting an activity, i.e. avoiding sunburn, bee stings and snake bites, hygiene, who to alert in the event of an accident/emergency, etc. Tailor this to the age of your group in an appropriate and positive way. The point is not to scare anyone, but to make them aware of their surroundings and what procedures to use. Don’t assume that everyone has basic common sense about safety.

**Communication is Key**

Speak with clarity. Non-verbal communication speaks loudly (eye contact, body language). Use inflection and vary pitch and tone to get and keep the audience’s attention. Communicate right off the bat about expectations, guidelines and procedures. Tell your group the objectives or learning goals of the day so they know what to expect. You can’t get somewhere without knowing where you are going!

**Attitude is Everything**

“Learning is caught, not taught.” As leader, facilitator, or teacher, you will set the pace with your attitude. Enthusiasm is contagious. If you are having fun, chances are that your students will as well. One caution: don’t let your enthusiasm for the topic being taught determine the pace at which you are moving. Slow down when necessary to get the point across.

**Give Feedback**

Students need positive and constructive feedback. Encourage the people in your group. It is best to give it as soon after the experience as possible. Don’t offer “false feedback,” for example telling a student that they gave a great presentation when you really don’t believe this to be true. It undermines your credibility and might inhibit them from receiving positive comments that you really do mean.

The “Sandwich” or “Oreo” technique can be useful here: Begin with positive feedback on what the group/individual did well, progress to the areas which could be improved upon, then end by returning to one or two of the major positives. Leave them with the incentive to build on what they have already done. Remember that feedback does not have to be in the form of statements. Drawing his or her own self-critique out via the Socratic Method can be very effective.
Get Students Involved

Students often learn the most from what they teach themselves and what they teach each other. This is a central tenet of learning by doing. Teach others to be teachers. Be familiar with the strengths of your students. A good teacher is also willing to let go of his or her ego (defined here as the positive sense of self derived from being seen as the “expert”) in order to optimize the learning for the students.

Empathize with the Students/Participants

Remind yourself of what it feels like to learn new things. I sometimes imagine myself sitting in the group listening to the presentation I’m giving while asking myself if I would be interested in the way it was being put forth. Listen carefully to the questions being asked but try to “listen” to those not being asked for fear of embarrassment. Create a relaxed atmosphere whereby students feel comfortable asking any question.

Use a Variety of Teaching Methods

Be creative; surprise people. Create an atmosphere whereby the student goes into the experience asking “I wonder what will happen today.” Create an atmosphere of anticipation. “I wonder what lives in that log.” The easiest way to teach a subject is not necessarily the best way. Any group will have students or participants with a wide variety of learning styles. Utilize a wide array of teaching methods in order to reach a larger number of students. If you can touch on the dominant learning style of a student, it can sometimes open doors to learning through other, less developed styles.

Utilize Teachable Moments

Be observant of what is going on around you as you teach, particularly of what is capturing students’ attention. Deviate from your plan or schedule as the opportunity arises. Encourage epiphany. Help students to realize that you cannot separate the classroom and life, for they both contain uncertainty and unscheduled events. Emphasize that learning is a lifelong process.

Be Organized but Flexible

Most people don’t plan to fail, they just fail to plan. If teachers/leaders are not prepared, it can communicate to students that they are unimportant. Never be so tied to your plan that you refuse to deviate from it as the situation requires. A good teacher has developed a “barometer” for the mood of the group and will respond to those “readings” accordingly.
Humor

Humor can be effective in creating a relaxed atmosphere provided it is not in poor taste. Humor grabs our attention. Everybody likes to laugh.

Know your Subject

Substance is important. Great teaching is not simply a function of method. You should know what you are talking about because you have done YOUR homework. Some experts say that you should know up to seven times as much as you will actually teach. I have found that this varies depending on the subject taught. For example, if I am teaching a lesson on Techniques of River Rescue, I want them to know practically everything I know about the subject. Never bluff your way through an answer when you are asked a question about which you do not know the answer. It is fine for a teacher to say “I don’t know.” It demonstrates integrity and can help to close the perceived gap between the “expert” and the learner.

Be Yourself

Develop your own style around your gifts and talents. Don’t be fake. Students will appreciate the fact that you are true to yourself, and it sets a positive example for them to be genuine in their work and in their everyday lives.

Teach the Pupils, not the Subject

Be concerned with your students’ needs. Meet people where they are. At the same time, recognize that you may have a few students who will attempt to use this aspect of your teaching against you by manipulating you. Sometimes, love must be tough. Some of the more important “lessons” may come from how you choose to respond to these situations.

Read the Pupils, not the Text

Determine the interests of the group. Pay attention to non-verbal clues. Take short breaks or use creative activities to break up long periods of sitting. Draw out information from the students whenever possible instead of simply telling or reading them the information.

Be Willing to Take Risks

Environmental educators of any type are often asking their students to take physical, mental, or emotional risks through the activities in which they are involved. A good teacher is willing to take risks, to try new things in order to find a more effective way to teach.
READING 3.3 - Behavior Management

Read the following tips for preventing misbehavior and reflect on your own experiences. Record any other tips or helpful tidbits from the class discussion.

- Set clear expectations right at the beginning so there is no time for misbehavior before you have established consequences. Don’t assume that proper behavior is common sense. Most kids need to be told directly or they will test your boundaries!
- Create “buy in” for your expectations. If students understand why you have certain expectations, they are more likely to follow them. Explain that even adults have to follow similar rules on the job and if they don’t, they get fired! Consider having them come up with conduct expectations and consequences and add any that they missed.
- Create a good rapport with students. Smile, look them in the eye, have interest in them as individuals, display excitement and enthusiasm.
- Show them the same respect that you expect from them. Avoid being an authoritarian, yelling, or calling students out in front of the group.
- Motivate them. Keep it fun, keep them on task, and keep them engaged. Remind them of fun activities ahead if they are getting squirmy or take it as a sign that it is time to move on.
- Provide positive reinforcement of good behavior. Misbehavior is often attention seeking, so provide individualized attention for positive behavior early on in the program.
- Assert yourself. Act confident in your behavior, decisions and actions. Be a leader.
- Be consistent. If you have to change a rule, explain why. Require the same rules for all students.
- Give the students ownership. Ask them what sort of behaviors should be exhibited and what behaviors should be avoided. Wait for answers and then ask what should happen if they don’t follow rules.
- Follow through. If you say that throwing mud is unacceptable and after one warning you will have to sit out of the activity, and someone throws mud, you must follow through.

Notes from group discussion:

Adapted from the Central Wisconsin Environmental Station
There are two main factors that increase the risk of accidents in the outdoors. They are **environmental hazards** such as terrain and weather and **human factor hazards** such as experience level and skill. Some people just don't know how to avoid risks. So when planning an outdoor lesson, we must assess the area for environmental hazards and inform our participants how to best avoid these hazards. Remember to be sensitive to how you deliver safety information. It is important for participants to learn how to avoid risks, but we certainly don't want to instill unnecessary fear of the outdoors.

Before your participants arrive, provide them with information so they can be prepared for an outdoor experience. You have to decide, depending on the group and the activity if you are going to allow students to participate if they don't come prepared.

1. Wear light colored, long sleeve clothing to avoid mosquitoes, ticks, and other insects.
2. Wear closed toed shoes and long socks to protect your feet and ankles.
3. Apply sunscreen before going out to avoid sunburn.

Always carefully survey your outdoor study sites for potential hazards before you take participants outside.

1. Plan your route to and from your study site ahead of time. Walk through it and evaluate the route with safety considerations in mind.
2. Determine and define the boundaries of the study area. Make sure students know the boundaries. Consider using brightly colored flags or surveyor's tape to mark boundaries.
3. Check for bee or wasp nests and for flowering plants that may attract large numbers of pollinating bees and wasps.
4. Learn how to identify Poison Ivy and check for it.
5. Know how to contact your nearest poison control center to find out what to do if a student eats a poisonous plant.
6. Be aware of any student allergies and become familiar with the techniques for responding to allergic reactions.
7. Be aware of potential human-generated hazards such as trash, broken bottles, or other sharp objects.
8. Have quick access to a basic first aid kit, and know basic first aid procedures.
Safety Considerations when Teaching Outdoors

When your participants arrive, before going outside, review some basic safety skills:

1. Describe the site to them and inform them of the boundaries.

2. Explain to them the importance of not disturbing wildlife, such as snakes and stinging insects. Remind them to observe rather than grab.

3. Warn students not to eat plants or anything else they find outside for that matter. This seems like common sense, but you would be surprised what kids will do!

4. Tell students to inform you if they have allergic reactions to plants or bee stings in case you weren’t given all the information before hand.

5. Remind them to slowly move away from flying, stinging insects, rather than swatting.

6. Most importantly, if someone does get hurt or stung, even if it doesn’t seem like a big deal, tell them to inform you or another adult with the group immediately.

7. Remind them to have fun, be smart, and use common sense!

READING 3.5 - Maslow’s Hierarchy of Needs

- **Self-Actualization**
  (Achieving individual potential)
- **Esteem**
  (Self-esteem and esteem from others)
- **Belonging**
  (Love, affection, being a part of groups)
- **Safety**
  (Shelter, removal from danger)
- **Physiological**
  (Health, food and sleep)
SECTION IV
TEACHING METHODS

Estimated Time: 1 Hour

This section provides participants with a sampling of teaching methods that are specifically helpful in environmental education and outdoor teaching situations. In interest of time, you will focus on the concepts of the teachable moment and inquiry learning. It also uses the “5E Learning Cycle” as a teaching method example to help participants organize and sequence instruction.

Purpose: To provide participants with a sampling of teaching methods and in-depth information on inquiry.

1. Explain to participants that it is very appropriate that the first component of environmental education is Awareness. As environmental educators, it is essential to leverage the natural curiosity of children and adults to effectively communicate program content.

2. Explain that one teaching method used extensively in the field is the “teachable moment.” Beth Lewis, teacher from California and the former Elementary Education Guide on About.com offers this often quoted definition: (Refer to Reading 4.1)
   
   A teachable moment is an unplanned opportunity that arises in the classroom where a teacher has an ideal chance to offer insight to his or her students.

3. Explain to the group that in our field, where the classroom is the whole of the natural and built environment, the teachable moment is especially useful, if not necessary, to leverage. Note that the teachable moment is an excellent example of inquiry learning. In effect, environmental education as a whole can be seen as a form of inquiry learning. Environmental education strives to provide learners with the awareness, knowledge, attitudes and skills to make their own informed decisions. Similarly, inquiry-based learning is inherently student-centered and relies on student discovery and questions to motivate learning. Paula Sincero, educator and inquiry advocate, notes: (Reading 4.1) Inquiry-based learning is a learning process through questions generated from the interests, curiosities, and perspectives/experiences of the learner. When investigations grow from our own questions, curiosities, and experiences, learning is an organic and motivating process that is intrinsically enjoyable.
   
   That’s exactly how environmental education should be!

Quoted from http://www.inquirylearn.com/Inquirydef.htm
Have participants read the excerpt on Inquiry, Reading 4.1, from the Exploratorium in San Francisco (featured in Inquire Within: Implementing Inquiry-Based Science Standards in Grades 3-8) The bullets on the handout have been paraphrased from the quote below:

*Inquiry is an approach to learning that involves a process of exploring the natural or material world, and that leads to asking questions, making discoveries, and testing those discoveries in the search for new understanding...*

*The inquiry process is driven by one’s own curiosity, wonder, interest, or passion to understand an observation or to solve a problem.*

*The process begins when the learner notices something that intrigues, surprises, or stimulates a question—something that is new, or something that may not make sense in relationship to the learner’s previous experience or current understanding.*

*The next step is to take action—through continued observing, raising questions, making predictions, testing hypotheses, and creating conceptual models.*
4. One way to organize an inquiry-based lesson is through the “5E Learning Cycle.” This method dates back to the early 1970s and is still used in various forms to encourage inquiry. Ideally, this process creates a cycle of student-centered learning. The 5E method can be applied to shorter lessons or can be used for experiences over several days, such as an adult workshop, children’s camp or school classroom unit. Again, emphasize that the 5E is only one way of organizing a lesson, and will be used to show the importance of good planning, organization and sequencing. Participants may want to research other lesson organization models on their own. Others include the Six Point Lesson Plan, Madeline Hunter’s 7 Step Lesson Plan and Gagne’s 9 Events of Instruction.

Review this with participants on Reading 4.2.

Adapted from Inquire Within: Implementing Inquiry-Based Science Standards in Grades 3-8, Second Edition (134-163) and http://faculty.mwsu.edu/west/maryann.coe/coe/inquire/inquiry.htm)
http://enhancinged.wgbh.org/research/eeeee.html
5. **5E Activity:**

Divide the participants into groups or pairs (your choice). The participants will create a simple 5E lesson on the long leaf pine ecosystem, based on the information provided in Reading 4.3 (excerpt from *Rooted in Time, the Weymouth Woods State Natural Area EELE*). *Note to the participants that they will use this lesson throughout the workshop.* This lesson should not be detailed—its purpose is to get participants familiar with inquiry and the 5Es as a possible way to structure learning. Have participants use Worksheet 4.1 to quickly outline an inquiry lesson based on the 5Es. If time allows, have each group briefly share their lesson. Note that while the 5E format would not be practical in all situations, elements of it can be effective when developing lessons. An example of a 5E lesson is on Reading 4.4.

**Note:** You (the facilitator) may choose another topic instead of the longleaf pine ecosystem for the 5E lesson, but you should still assign all the groups the same topic. This will help when participants reflect and share ideas throughout the workshop, as participants will use their 5E lesson later to create objectives, plan age-appropriate activities and correlate to the N.C. Essential Standards.

6. **Modeling Teaching Methods Activity:**

For this activity, you will need to copy and separate the various teaching methods in Reading 4.5 to hand out to the group.

a. Keep the participants in the same groups or pairs. Hand out the teaching methods randomly to the participants. Hand each group multiple methods.

b. Have participants select one method from the slips you hand them, and then prepare a short (2-3 minute) lesson based on the longleaf pine ecosystem information provided in Reading 4.3. Or, tell them they may want to modify an element of their 5E lesson plan into a different teaching method.

c. Have the participants share their lessons, making sure they stay within the 2-3 minute time limit. Have each group or pair briefly discuss the advantages, disadvantages and things to consider about each method. Also discuss why they selected their particular method over the others they were given.

**The methods are:**

- Action Projects
- Audio-Visuals (Transparencies, Models, Music)
- Community Studies/Case Studies Issue Analysis
- Demonstration
- Debate/Dialectic
- Discovery Demonstration
- Discussion
- Experience
- Exposition
- Exposition with Interaction
- Facilitation
- Games
- Guest Speaker
- Guided Discovery or Exploratory Learning
- Moral Dilemmas
- Open Inquiry
- Peer Teaching
- Projects: Individual/Group
- Skits or Role Plays
- Socratic Method/Inquiry
- Story-telling
- Teachable Moment
Teachable Moments

Beth Lewis, a teacher from California and the former Elementary Education Guide on About.com offers this often quoted definition:

A teachable moment is an unplanned opportunity that arises in the classroom where a teacher has an ideal chance to offer insight to his or her students.

Inquiry

Inquiry-based learning is a learning process through questions generated from the interests, curiosities, and perspectives/experiences of the learner. When investigations grow from our own questions, curiosities, and experiences, learning is an organic and motivating process that is intrinsically enjoyable.*

Inquiry Learning:

- Leads to asking questions, making discoveries, and testing those discoveries...
- Is driven by one’s own curiosity, wonder or interest...
- Begins when the learner notices something that intrigues, surprises, or stimulates a question...
- Takes action through continued observing, raising questions, making predictions, testing hypotheses...+

*Quoted from Paula Sincero http://www.inquirylearn.com/Inquirydef.htm

+Based on excerpt from Inquire Within: Implementing Inquiry-Based Science Standards in Grades 3-8
1. **Engage:** You as the instructor set the stage for the lesson by using a “teachable moment,” an object, or by posing an intriguing question or problem to the students.

2. **Explore:** Students do hands-on activities, experiments or field investigations on their own.

3. **Explain:** Students are given opportunities to explain their observations and findings. The information gathered by the students is collected, shared and reviewed. This is also an opportunity for the instructor to introduce specific skills, explain concepts or introduce new formal terms and definitions.

4. **Elaborate:** Students use the skills, knowledge and concepts they have gained and apply them to new situations or “real-world” problems.

5. **Evaluate:** You help the students access what they have learned. This could be through traditional tests, student self-assessments, essays, or other methods.

Note: Reading 4.4 provides an example of a 5E Lesson.
The Ecology of the Sandhills

This activity focuses on the habitat of the Sandhills' plant communities. In this exercise, you will observe the habitat of specialized plant communities and recognize the positive effects prescribed burns have on these plants. Ecology refers to the interrelationship between living beings and their surroundings. The ecology of the Sandhills is therefore the relationship between the plants and animals and the soil, water and air upon which they depend. Ecology also includes the relationships with natural phenomena, such as wildfires, tornadoes and hurricanes.

An important part of the ecology of the Sandhills is fire. Fire helps keep the longleaf pine forest open by limiting the growth of shrubs and hardwoods. It opens up the understory and allows a rich array of wildflowers and grasses to quickly resprout from their underground roots. They thrive in the abundant sunlight and nutrients released from the ash of burned plants. Fire also prepares seed beds for longleaf pine by removing fallen leaves and exposing the mineral soil necessary for successful longleaf seed germination.

Many animals found in the Sandhills region depend on fires to maintain the open longleaf pine habitat. One interesting example is the red-cockaded woodpecker, a federally endangered species. A full-time resident, the bird makes its home only in the heartwood of living, old-growth longleaf pine trees. Another example is the fox squirrel. This large, secretive squirrel varies in color from gray to black and is rarely found outside of the longleaf pine, turkey oak and wiregrass ecosystem. A prescribed burning program is the only safe and effective way to maintain the habitat needed by both of these beautiful creatures.

Before European settlers came to this country, the Sandhills burned periodically due to lightning strikes and fires set by Native Americans. The European settlers extinguished all fires to protect their settlements. Soon, the longleaf pine forest filled in with hardwoods and shrubs, and all of the beautiful wildflowers and grasses began to disappear. Scientists discovered that by setting prescribed fires, which mimic natural fires, the native animals, wildflowers and grasses of the Sandhills could be restored.

Weymouth Woods - Sandhills Nature Preserve has a prescribed burning program to manage its longleaf pine forest. The preserve is broken into small sections that are surrounded by firebreaks which are mowed and raked to ensure that the fire will remain in the desired areas. These areas are burned approximately every two years when conditions, such as moisture and wind are favorable, and when trained personnel are available. This resource management program maintains the unique plant and animal communities of the longleaf pine forest.
Soil Moisture Measurement

The amount of moisture found in the soil is one of the determining factors in the type of plant communities that will grow in an area. Different species of plants have adapted to the amount of water needed for survival. The Sandhills region is known for its deep, sandy soils and large amounts of rainfall. However, rain water flows very quickly through these sandy soils and is not held near the surface for long. The Sandhills’ plants have adapted by developing extensive root systems. For example, longleaf pine trees develop a long tap root that can reach water far underground, even in the dry, hot summer. Other plants, such as wiregrass, develop a root system that is shallow, but very wide and dense. Any water moving down from the surface is soaked up quickly and stored for use in dryer times.

Some Sandhills’ plants also have ways to conserve water. For example, young turkey oaks twist their leaves so that the surface of the leaf is not facing towards the sun. This reduces the amount of water lost to transpiration.

NOTE:
While you are working on this project, remember that all plants and animals in state parks and recreation areas are protected. Do not disturb the plants by picking or trampling them.
There are different groups of plants just like there are different groups of animals. We group animals into birds, mammals, reptiles and so on. Similarly, we can place trees into one of two large groups: hardwoods or conifers. Hardwood trees have flat leaves of varying width and produce flowers. Many, but not all, hardwood trees are deciduous. In the spring, they sprout new leaves from buds that were dormant during the winter, and in the fall, the leaves change color and drop to the ground. Coniferous trees have scaly or needle-like leaves and produce cones. Many conifers are also called evergreens because the trees appear to remain green throughout the year.

Within each of these large groups there are family groups of trees, such as the oak family in the hardwoods and the pine family in the conifers. The families can be broken down into individual members with their individual names just like your own family. The individual family members are called species such as the turkey oak species in the oak family and the longleaf pine species in the pine family. The longleaf pine species will be the focus of this exercise.

The longleaf pine is a special species of pine because of its ability to prosper in the area known as the Sandhills region of North Carolina. The Sandhills is a sometimes harsh environment in which to live because any plant growing there must have the ability to find or store water and also be able to survive the wildfires that once burned across the land. The longleaf pine has developed ways to survive such harsh conditions, starting from the time the seeds hit the ground.

The seed has a wing attached to it so that the wind can carry it to an area away from the main tree (see illustration). When these seeds start to fall, they are sometimes called “helicopters” because they spin like a helicopter propeller. Very soon after landing on suitable soil, the seed germinates. In the Sandhills there are basically two types of soil. One is called organic soil and is composed of peat (dead decaying plant material). The other is mineral soil and is composed...
of sand. Longleaf pine seeds grow best when they land on mineral soil.

After germination, the young pine consists of a few small pine leaves and a developing root system. In this stage of life, the longleaf pine’s root system is basically the only part of the tree that grows. This first stage of growth is called the seedling stage, or grass stage, because the longleaf pine looks like a clump of grass. Most of the growth is taking place underground where the tap root is growing longer and longer. This long root will help the tree survive periods of dry weather by reaching deeper and moister soil and also storing water. The needles above the ground grow to their full size of 10 to 15 inches, but there is no stem or tree trunk yet. In the winter and early spring, these long needles protect the terminal bud (see illustration) from wildfires that burn across the land. The longleaf pine may stay in this stage for three to seven years.

After the initial period of root system growth, the longleaf pine is well established and now begins to grow upwards. The terminal bud begins to shoot upwards, creating the stem or trunk of the tree. The needles stick out along the newly formed trunk. No limbs appear on the longleaf pine until the environmental conditions are just right. This stage is called the sapling stage, or “bottlebrush,” because the tree looks like a brush that is used to clean bottles (see illustration). It may take a few years before the longleaf pine begins to grow limbs and many years before it is old enough to produce its first pine cone.

The first pine cone may not be produced until the longleaf pine is 20 to 25 years old. This stage is called the mature growth stage and may last until the tree reaches its last stage at 100+ years. The thin limbs of the longleaf pine will be near the top of the tree as the lower limbs fall off. All the long needles are located at the end of each stem creating a cheerleader’s “pom-pom” effect. During this period, the tree is very productive and is producing pine cones full of seeds.

Pine cone production is very important for the longleaf pine tree and the animals that eat the seeds. This makes the mature growth stage important for reproduction and survival of the longleaf pine forest ecosystem. The longleaf pines that make it to this stage will grow two kinds of pine cones; pollen cones and seed cones. The pollen cones or male cones called strobili, produce pollen and can be found growing as a group on the end of each limb in the spring (see illustration). In most other species of pines, pollen cones are yellow, but the male cones of the longleaf pine are purple.

The yellow pollen that comes from the strobili spreads through the air like dust. Once all the pollen is shed from the
male cones, they fall to the ground.

**Seed cones**, or female cones, are at first very small and sticky. Pollen grains carried by the wind stick to a seed cone. Tubes grow from the pollen grains into egg cells inside the seed cones. Sperm enters an egg cell and **fertilizes** the egg. Each fertilized egg cell grows into a seed. The green, female cone matures during the summer months. Once the seeds are formed, the now brown pine cone opens up, and the winged seeds fall to the ground starting the whole process again.

The longleaf pine enters its last stage of growth when it reaches over 100 years of age. This stage, called the old-growth stage, can be recognized because all the limbs, now thick, are near the tree’s top. They are curved or bent, which makes the tree look flat-topped (see illustration). The trees that make it to this stage are called “flat-tops.” Flat-topped trees do not grow any taller but grow thicker trunks and limbs. They can still produce pine cones. The longleaf pines in the old-growth stage can live until they are 300 to 500 years old. The presence of old-growth longleaf pines is critical to the survival of the federally endangered red-cockaded woodpecker. This bird will only construct its nesting cavity in old-growth pines. Without them, this species would become extinct.
## Lesson Topic: Meal Worm Investigation
This lesson is based on Investigating Mealworms, pages 137-43 in *Inquire Within*

### Engage
Set the stage for the lesson by using a “teachable moment,” an object, or by posing an intriguing question or problem to the students.

Show students live and dried mealworms and ask if they know what they are, allowing for students to guess. Explain what mealworms are as well as some of their uses (bird food for birds that prefer live prey, pet food, etc.)

### Explore
Students do hands-on activities, experiments, field investigations, etc. on their own.

Students will collaborate in small groups to raise mealworms in the classroom. (To shorten this activity, students could observe various mealworm life cycles)

### Explain
Students are given opportunities to explain their observations and findings. The information gathered by the students is collected, shared and reviewed. This is also an opportunity for the instructor to introduce specific skills, explain concepts or introduce new formal terms and definitions.

Students will log their observations in journals and will report to the other groups and teacher. Make sure the life cycle observations are correct, and follow up with direct instruction about their life cycle. Groups could also create simple posters of their findings.

### Elaborate
Students use the skills, knowledge and concepts they have gained and apply them to new situations or “real-world” problems.

Each student group will develop ideas to use the mealworms they have raised. Possible outcomes could be sharing the mealworms with a nature center to feed birds or educational animals, or sharing their worms with another school to do similar projects. Students will then devise the plan, including letters to the school, nature center, etc. and working out the logistics of transporting the worms.
READING 4.5 -
A Variety of Teaching Methods

Action Projects

Description: Students take leadership on a specific project for the school or the broader community.

Uses: Good final project
Can lead to public recognition

Advantages: Allows students a chance to put into practice what they have learned
Enhances critical thinking

To Consider: Can be time consuming or controversial

------------------------------------------------------------------------------------------------------------------------------------------

Audio-Visuals (Transparencies, Models, Music)

Description: Utilizing a variety of tools to aid in teaching such as videos, television, slides, audiotapes.

Uses: To illustrate concepts which are difficult to comprehend by describing them

Advantages: Gets students involved with media they may already know
Can create an environment
Keeps attention
Aids visual learners (picture people)

To Consider: Less interaction
Time factor

------------------------------------------------------------------------------------------------------------------------------------------
Community Studies/Case Studies/Issue Analysis

Description: Students study real life situations that they can learn from

Uses: To understand actual problems encountered in the world

Advantages: Students learn research, inference and application skills

Enhances critical thinking

To Consider: Can be time consuming

Students may miss the point of the study if not similar enough to what they are studying

Debate/Dialectic

Description: Teacher assigns roles and a specific problem

Students learn from interacting and understanding different points of view

Uses: Learning to understand and respect different points of view

Learning to synthesize opposing positions

Advantages: Students are totally involved

Research is needed for the debate to be successful

Enhances critical thinking

Encourages verbal skills

Serves as a laboratory for many lessons involving group communication.
**Demonstration**

**Description:** Stand before class, show something and describe

**Uses:** Difficult concepts that are hard to visualize

**Advantages:** Works well if the demo is too difficult for the students to do

- Provides a visual; Can be very dramatic and have a substantial impact

**To Consider:** It may not work (for example a chemistry experiment)

- Visual only
- Length of time: Students may get restless

---

**Discovery Demonstration**

**Description:** Teacher conducts silently and the students describe

- Students get to watch but are encouraged to make verbal observations

**Uses:** Follow up to a regular demonstration

- Students get a chance to share what they know or as the main demonstration

**Advantages:** Work well if demonstration is too difficult for the students

- Can have a lot of impact
- Good for problem solving, critical thinking

**To Consider:** What if it doesn’t work? Have alternative method ready to roll

- Only some students will make verbal comments
**Experience**

**Description:** Non-directive learning. Students learn from their success and failures through direct real-life experience.

Beyond planning the activity, there is an absence of teacher involvement.

Questionable as to whether this really constitutes a method.

**Advantages:**
- No teacher is required
- Students can learn from mistakes
- Great transfer of learning

**To Consider:**
- Safety could be a problem
- Students may learn the wrong behavior
- No interaction with teacher
Exposition

Description: Lecture, conveying information via one way communication, very little dialog if any.

Uses: Introductions, Directions, Short Explanations
       Conclusions

Advantages: Much information in a short period of time
             Helps students learn to listen
             Easy for the professor

To Consider: Verbal only
             Limited attention spans
             Passive Learning
             Student logic not equal to teacher logic
             What is said may not be equal to what is heard

Exposition with Interaction

Description: Lecture/Discussion with questions encouraged

Uses: Review
       Introducing New Information

Advantages: Can get much information across
            Students learn to listen
            Students can get clarification.

To Consider: Verbal only, Passive
             Questions may be limited to a few students
Facilitation

**Description:** Teacher acts as facilitator for a particular experience by setting it up, allowing it to happen, and processing it afterwards through a series of sequenced questions.

**Uses:** To maximize the learning potential of an experience

**Advantages:** Learning comes from the experience, making it more tangible

- Better retention

**To Consider:** Teacher must be able to sequence the questions

Teacher must be skilled at reading groups

Games

**Description:** To teach facts, ideas, or concepts through a game

**Uses:** To illustrate concepts by group interaction or to break up the routine of a class.

**Advantages:** Fun; Burns off excess energy; Involves whole person

**To Consider:** Some may feel silly playing the game

Guest Speaker

**Description:** Having someone with expert information present information to the students

**Uses:** When the topic centers on specific areas of expertise (space exploration, medicine, etc.)

**Advantages:** Renews the interest of students

- Students may be eager to hear “expert”
- Breaks up routine

**To Consider:** Speaker may be boring

Speaker not aware of audience/or needs of students

May not cover what you would like for him to.
Guided Discovery or Exploratory Learning

**Description:** Students are directing the learning with only slight directions from the teacher

**Uses:** When you can have direct contact with the materials

**Advantages:** Students are totally involved in the material

Students manipulate and make new discoveries

**To Consider:** Must have discovery questions prepared

Must have enough equipment for everyone

Sometimes noisy and chaotic

Different end times

Moral Dilemmas

**Description:** Teacher presents difficult questions/dilemmas for students to consider

**Uses:** Used to develop personal views about issues.

**Advantages:** Enhances critical thinking and understanding of personal philosophy

**To Consider:** Some may not wish to share their personal philosophies publicly

Open Inquiry

**Description:** Teacher presents a starting problem, students work toward solution

**Uses:** To enhance critical thinking about a problem

**Advantages:** Students are totally involved

Content is focused by students

Good for problem solving and critical thinking

**To Consider:** Not easy to teach specific content

Noisy

Teacher must be willing to say “I don’t know”

Different end times
Peer Teaching

**Description:** Teacher allows students to teach and share their knowledge

**Uses:** Used toward the end of a lesson or unit

**Advantages:**
- If you can successfully teach someone else, you have really learned the concept.
- Allows students the chance to practice presentation skills

**To Consider:**
- Takes time for everyone to have an opportunity
- Difficult when someone isn’t prepared
- Some students have difficulty speaking in front of their peers.

Projects: Individual/Group

**Description:** Teacher provides a problem or situation that the group must solve

**Uses:**
- To provide time for further depth
- To foster group cooperation

**Advantages:**
- Students gain depth
- Good example of what the real world is like
- Enhances critical thinking

**To Consider:**
- Students learn a lot about only one topic
- Group dynamics may overshadow group project.
Skits or Role Plays

Description: Acting out a story or scenarios in the hopes of conveying to the audience certain facts or ideas

Uses: To illustrate concepts or historical events

Advantages: Active: gets students involved

Humor

Helps students visualize

To Consider: Can flop

Must be entertaining

Time consuming

Socratic Method/Inquiry

Description: To facilitate learning by asking questions

Uses: To develop content, definitions, and concepts

Advantages: Works from what students already know

Makes a formal connection

Better retention rate

Encourages students to think

To Consider: Must know audience

Must sequence questions

Problem when students aren’t prepared

Must have alternative plan ready

Summarization important
Story-telling

**Description:** Relating facts, concepts, or ideas through the use of story

**Uses:** As a lead in to a topic or to give an illustration/example

**Advantages:** Grabs interest
- Can relate to a real life scenario
- Stories hit home

**To Consider:** Time consuming
- Need to be a good reader or storyteller
- Can get bored

Teachable Moment

**Description:** Teacher utilizes an event caused, initiated, or discovered by the students to share insight and information.

**Uses:** Wide variety of settings in nature

**Advantages:** Real-life learning
- Provides immediate insight
- Students learn through experience
- Students learn to observe and to be more attentive to surroundings

**To Consider:** Teacher must be alert and in control. Can draw conclusions for the student instead of letting them make their own. Teacher must be flexible and sensitive.
SECTION V
PRACTICING DEVELOPMENTALLY APPROPRIATE EDUCATION

In this section participants will discuss what developmentally appropriate practice means and why it is so important to environmental education. You will also help them explore developmental stages and resources to help the participants plan developmentally appropriate programs.

Purpose: To provide an overview of developmentally appropriate practice.

Ask participants to read Reading 5.1, Save the Elephants: Don’t Buy Ivory Soap by Katie Slivovsky. After they have had time to read it, remind participants of David Sobel’s article Beyond Ecophobia. This should be a review from the Basics of Environmental Education. Tell them that Sobel emphasizes three things about age-appropriate environmental education:

- **Empathy** between the child and the natural world should be a main objective for children ages four through seven;
- **Exploring** the nearby world and knowing your place should be a primary objective for the “bonding with the Earth” stage, from age eight to eleven and
- **Social action** appropriately begins around age twelve and extends beyond age fifteen.

1. Facilitate a discussion allowing participants to reflect on the article and to talk about their own experiences working with different age groups. This will create a transition to the discussions and activity on developmentally appropriate practice.

2. Refer the participants to Reading 5.2 on developmentally appropriate practice, asking someone to define it in their own words, based on the definition in Reading 5.2. Ask participants how they have matched the learning environment (i.e., the physical set-up, materials, schedule, curriculum, teaching methods) to the developmental level of children, teens or adults. Note to the participants that the online appendix has a Ten Effective DAP Teaching Strategies one-page document that is very helpful. Also note that the publication Natural Wonders, a Guide to Early Childhood Environmental Education is an excellent resource for planning developmentally appropriate lessons for young children, and a link to it is also available in the online appendix.
3. Instruct each participant to read Reading 5.3 on Piaget’s developmental stages and allow ten minutes for this review. Ask participants if they are familiar with Piaget’s stages and if they could apply this information when developing their programs and lessons. Reading 5.4 has a more in depth look and concrete examples of developmental stages for ages 5-14. Note to the participants that the online appendix has more information and readings on developmentally appropriate practice as it relates to environmental education, including the National Association for the Education of Young Children’s Twelve Principles of Child Development and How Early Childhood Environmental Education Differs from Environmental Education for Older Students and Adults from the North American Association for Environmental Education. Early Childhood Environmental Education Programs: Guidelines for Excellence.

Conclude these discussions by emphasizing to the participants that it is important to remember that all children develop at their own rate, so some children exhibit characteristics of stages above or below their level. Development and learning proceed at varying rates from child to child, as well as at uneven rates across different areas of a child’s individual functioning.

4. Divide the participants into five groups. Each group will receive one of the “KNOW YOUR LEARNERS” cards (Facilitator Resource 5.1). The groups will now work together to create a simple lesson or learning activity based on the longleaf pine ecosystem information that is age appropriate for their group. Encourage them to incorporate some of the teaching methods from Section IV.

5. Have the groups briefly share the basic outline of their lessons and tell how they made their lesson developmentally appropriate. Offer suggestions if any of the lessons do not appear to be on the appropriate developmental level. Ask the participants to share their reflections on this activity and developmentally appropriate practice in general.
What happens when we talk to little kids about big problems?

Interpreters are passionate people. We care about preserving and protecting what we love—and we hope to motivate others to care, too. But sometimes I wonder if we care so much that we do more harm than good. Here’s an example of what I mean:

A female interpreter was in the Elephant House at a zoo, talking with a man and his five-year-old son. The boy remarked, “The elephants sure have big tusks.” The interpreter replied, “Yes, and did you know that elephants are being killed for their tusks? The males have the biggest tusks, so they’re targeted first, then the oldest females are shot, which can really mess things up because the females are in charge, and without them the herds don’t know what to do. Killing elephants for their tusks is a huge problem for elephant families.” The man and the boy said, “Thanks, we sure learned a lot today.” And the interpreter smiled.

I wonder what the interpreter really accomplished by talking about elephant poaching with a five-year-old. Though her language was developmentally appropriate, her message was not. How does a child reconcile feelings of awe and wonder about an animal he or she is looking at while hearing about how its relatives are being shot right and left?

Today, messages about endangered animals are reaching even the youngest kids. TV, children’s magazines, computer games, cereal boxes, and even well-meaning zoo educators and teachers sometimes tell tales of environmental woe. This is problematic for two reasons:

1) Young kids don’t “get it.”
Though it’s important for older kids to explore these concepts, many environmental problems are too abstract and complex for kids who are just learning to button their own coats. As an example, the title of this paper, “Save the Elephants: Don’t Buy Ivory Soap,” came from a campaign slogan written by an eight-year-old girl who had studied elephant poaching in school. She was old enough to hear the message but too young to really make sense of it.

2) It can turn kids off to nature.
Research suggests that when kids are overwhelmed with bad news, they cope by “disassociating” from it or tuning it out. Hearing about poaching, pollution, and habitat loss can be depressing and turn young kids off to nature just when they should be enjoying it most.

David Sobel, in his article “Beyond Ecophobia: Reclaiming the Heart in Nature Education” (Orion, Autumn 1995), theorizes that this kind of distancing is exactly what we force kids to do when we overwhelm them with bad news. Who wants to form an emotional attachment to
an elephant that might disappear tomorrow? Children survive by distancing themselves from what they find overwhelming. Sobel coined a term, “ecophobia,” to describe the fear of nature kids can develop when prematurely asked to deal with the environmental problems of an adult world.

As interpreters, we’re masters at using language and techniques that are developmentally appropriate. For example, we know we can captivate a room full of preschoolers by mentioning poop. We know if we’re studying owl pellets with third-graders, we’d better let them dissect one. Above all, we know not to ask a mixed-gender group of fifth graders to stand in a circle and hold hands. But along with our interpretive language and techniques, we must put our interpretive messages through the age-appropriate filter.

It’s not a cop-out to save big, complex issues like poaching, mass habitat destruction, and global warming for middle schoolers who are better equipped to handle them. Early and middle childhood is the time to lay the foundation for future caring by providing kids lots of positive, meaningful, joyful experiences. Louise Chawla of Kentucky State University found that most environmentalists attributed their commitment to “many hours spent outdoors in a keenly remembered wild or semi-wild place in childhood or adolescence, and an adult who taught a respect for nature.” Not a tough prescription to fill.

You may be surprised that educators from Brookfield Zoo suggest backing off from teaching young kids about endangered animals. After all, much of Brookfield Zoo’s work is about protecting animals around the world. It is a conservation organization with a mission: “to help people live more sustainably with nature.”

However, the zoo has come to interpret this mission much differently for younger kids than for teens and adults. Research shows that many environmentally active adults today have one thing in common: a childhood filled with fun, positive nature experiences. That’s why the focus of Brookfield Zoo’s new Hamill Family Play Zoo is all about providing these experiences for children from infants to 10-year-olds and their families. There won’t be information about endangered animals in sight.

So what if kids ask me about endangered animals?
Even if you don’t bring up an animal’s population status in the wild, a child may ask you whether or not it’s endangered. How you respond depends on the child’s development and age. For all ages, find out what the child has heard and let the child tell you the details. Ask about and acknowledge the child’s feelings. Here are some other suggestions by age level:

7 and under:
• Answer questions briefly and honestly: “Yes, tigers are endangered, and that’s not good. People are working to protect them, but it’s a tough situation.”
• Lift the burden from the child without disempowering him or her: “I know you are concerned about animals.
• There are grown-ups working hard on this problem, and maybe when you grow up, you can help out, too.”
Sometimes a young child gets the impression that all animals are endangered. You might say, “Some animals have problems finding homes, but many don’t. Robins, squirrels, and raccoons live right around here, and they’re doing great!”

7 to 11:
- Acknowledge the child’s feelings: “Where did you hear about elephant poaching? How did you feel when you heard about the problem? I know it’s a sad story, but people are trying to help.”
- Redirect to something more local and concrete: “I know it’s hard to think of what to do to help elephants. What can we do to help animals around here? That’s important, too--and it’s probably going to be easier for us!” Suggestions include picking up litter in natural areas, maintaining bat houses and birdbaths, planting native shrubs and flowers to attract local wildlife, and asking friends to help.

11 to 14 and up:
- Discuss ways to get involved locally like adopting an animal at a nearby zoo or aquarium or volunteering at an animal shelter.
- Initiate or help with recycling programs at school or in the community.
- Communicate concerns about the environment to legislators at the local, state, and national levels.
- Get involved with national and international conservation groups, such as The National Audubon Society, World Wildlife Fund, Defenders of Wildlife, and the African Wildlife Foundation.
- Be a model: share your thoughts about conservation actions you have taken or would like to take.

Keep in mind that the way you respond to a child’s question can be a subtle indicator to parents of how they might handle future conversations with their children about these issues.

If we want young children to grow into environmentally-conscious adults, let’s encourage them to play in nature and learn easy tasks like shutting off the water when they brush their teeth. Even Rachel Carson--and I can’t think of a more impassioned environmentalist--wrote Silent Spring for adults and The Sense of Wonder for families with young children.

As David Sobel puts it, “If we want children to flourish, to really feel empowered, let us allow them to love the earth before we ask them to save it.”
Developmentally Appropriate Practice - What does it mean?

Developmentally appropriate practice (DAP) is an early childhood education standard that was first described by the National Association for the Education of Young Children (NAEYC). According to NAEYC, developmentally appropriate practice is matching the learning environment—the physical set-up, materials, schedule, curriculum, teaching methods and so forth—to the developmental levels of children. It means understanding the developmental changes that typically occur from birth through age eight (and beyond), variations in development for individuals and how we can best support their learning and development during these years.

There is no magic formula for developmentally appropriate practice. Educators make decisions day by day, minute by minute, based on knowledge of how children develop and learn, the individual children and families in question and the environmental, social and cultural context (Bredekamp & Copple, 1997).

Developmentally appropriate practice in early childhood environmental education means making program choices that emphasize and support both the individual and collective abilities of children.

Why is it important?

Developmentally appropriate practice is based on decades of research and knowledge of how children grow and develop and are guidelines by which we can measure our effectiveness. The power of developmentally appropriate practice lies in the educator’s ability to make choices and decisions about what is best for the children and families he or she serves. We all know that educational practices are most effective when they are attuned to the way children develop and learn—that is, when they are developmentally appropriate.

What are the benefits of using developmentally appropriate practice?

Children have better comprehension and retention.
Because material is presented in a manner best suited to their developmental stage, the material is absorbed better than it would have been if it was designed for older children.

There are fewer struggles to get children to engage in the program.
Material presented in a developmentally appropriate manner is more interesting to students and naturally grabs their attention.

Children and adults can learn together.
Following a child’s lead often takes us in a much more interesting direction than any adult prescribed curriculum.

More diverse programming can reach more students.
Creating developmentally appropriate materials requires more diverse forms of interaction and presentation and reaches more diverse learning styles.
Why don’t educators use developmentally appropriate practices?
We tend to stay with a teaching style we are most comfortable with.
We tend to rely heavily on props, scripts or visual aids to do the teaching instead of allowing for more personal discovery, interaction and relationship building.
We tend to focus more on sharing facts about nature than on the process of learning.

What are possible behavior issues related to developmentally appropriate practice?
Often there are perceived behavior concerns when, in fact, the opposite is usually the case.
In developmentally appropriate programs, children have more freedom to think and do for themselves. Providing well-structured programs with the freedom to make choices actually keeps behavioral issues to a minimum. There are usually more behavior-based problems in programs that are rigidly didactic, require children to sit and listen for long periods of time or don’t encourage open-ended exploration. However, it may be necessary to change approaches for certain individuals, cultures and or abilities. Some children may require more structure, fewer options or less stimulation. Developmentally appropriate practice is by definition, tailoring programs to meet the needs of particular individuals and groups.

**READING 5.2 - continued**  
**Developmentally Appropriate Practice**

![Developmentally Appropriate Practice: Constructivism](image)

<table>
<thead>
<tr>
<th>MOST DEVELOPMENTALLY APPROPRIATE</th>
<th>SOMEWHAT DEVELOPMENTALLY APPROPRIATE</th>
<th>LEAST DEVELOPMENTALLY APPROPRIATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activities are attuned to the child's level of cognitive, physical and social development including props, setting, language and timing. Learning is easier for the child and teacher.</td>
<td>Programs are presented at an appropriate level in language but other aspects may be inappropriate. There is some struggle but most of the concepts are comprehended.</td>
<td>Information is presented at an inappropriate level involving props, setting, language and timing. Children learn little and are either bored or overwhelmed.</td>
</tr>
</tbody>
</table>

**Examples**

- Various learning stations such as water table with pond life, painting table with water colors, pond puppets and costumes and so forth are set up around the gathering area. Children are encouraged to choose at will between the activities offered. They are free to move about the area, play alone or with others, and explore materials at their own pace.

- Various learning stations are set-up around the gathering area and children rotate from station to station at the teacher's direction. Specific outcomes are expected at each station.

- Children sit quietly while a naturalist explains the water cycle using words like transpiration and precipitation.

READING 5.3 - Developmental Stages

Developmental Stages

What does it mean?
Psychologist Jean Piaget first described young children as having a unique set of physical, cognitive, social and emotional attributes that differentiates them from any other age group. He described the constructivist theory—that children construct knowledge out of their exploratory actions on the environment. This theory forms the basis of the modern interactive, hands-on approach to learning. Piaget also described how children's thinking changed over time. By observing children's behavior, he noted four distinct stages: sensorimotor, preoperational, concrete operational and formal operational. (See accompanying chart.)

Why is it important?
Young children think differently than adults. Because of this, we have difficulty interpreting their actions, emotions and reactions. They have little concept of the past, present and future; they confuse reality with fantasy; they think that everyone feels, thinks and acts like they do. It is essential for us to understand not only how young children think but why they think what they do and change our methods accordingly.

What are the benefits to recognizing developmental stages and characteristics?
Knowing your audience.
Knowing how young children think and feel is essential to developmentally appropriate practice and good teaching in any setting. It helps us respond to children appropriately. Our first response to a child's burst of illogical thought is too often to either correct them or dismiss it as cute. However, if we respond by asking questions, we can find out a lot about the mysteries of learning and thought. What are the challenges to recognizing developmental stages and characteristics?
It's difficult for adults to really think like children.
Once you've gone through the developmental stages yourself, it's nearly impossible to backtrack. Try to imagine having no concept of the past, present and future or believing in the tooth fairy. The best we can do is to incorporate theory into our teaching practices and try to remember what life was like without logical thought.

Why don't we recognize developmental stages and characteristics more?
We weren't taught to recognize these stages.
Unless you've taken classes specifically for early childhood education, it's likely you weren't exposed to the developmental theories of learning in young children. It takes practice to recognize certain characteristics. It's hard to master the mysteries of young children when you teach them infrequently. But once you catch on, the payoffs are immense.

What are possible behavior issues related to not recognizing developmental characteristics?
Unrealistic expectations.
Expecting too much or too little from children almost guarantees difficult or “inappropriate” behavior. The more you know about children's abilities the better chance you'll have for a successful program.
### Piaget’s Four Stages of Development

According to this concept, there are four stages of cognitive development:

<table>
<thead>
<tr>
<th>Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SENSORIMOTOR STAGE</strong></td>
<td>Babies are a bundle of reflexes. Very little intention to their movements. Rely on adults and environment for stimulation. Cannot think of an object when it is out of sight. Increasing awareness of relation between own actions, objects and environment. Major milestone is object permanence—holding an image or event in memory.</td>
</tr>
<tr>
<td>Babies and toddlers, birth to 2</td>
<td></td>
</tr>
<tr>
<td><strong>PREOPERATIONAL STAGE</strong></td>
<td>Little knowledge of cause and effect. Difficulty taking another’s point of view. Think inanimate objects have human feelings. Cannot understand that something remains the same even though it changes form. For example, a peanut butter sandwich cut into four pieces is more than one cut into two pieces. Lack logical thought. For example, a child might think that the moon follows him wherever he goes. Major milestone is the emergence of logical thought—thinking is no longer limited by perception.</td>
</tr>
<tr>
<td>Preschoolers, 2 to 6</td>
<td></td>
</tr>
<tr>
<td><strong>CONCRETE OPERATIONAL STAGE</strong></td>
<td>Begin to think more logically. Begin to reason and understand abstract concepts. Understand moral concepts of rules, intentionality and justice. Major milestone of this stage is the mastery of logical thought.</td>
</tr>
<tr>
<td>Ages 6 to 11</td>
<td></td>
</tr>
<tr>
<td>Elementary, Grades K-5</td>
<td></td>
</tr>
<tr>
<td><strong>FORMAL OPERATIONAL STAGE</strong></td>
<td>Can reason about the past, present and future. Can think about their own thoughts and feelings as if they were objects. Major milestone is the development of hypothetical and deductive reasoning abilities.</td>
</tr>
<tr>
<td>Ages 12-19</td>
<td></td>
</tr>
<tr>
<td>Middle and High School, Grades 6-12</td>
<td></td>
</tr>
</tbody>
</table>

# READING 5.4 -
Developmental Characteristics and Interests of School-Age Children

## Transition Years Grades K-1 (5-6 years)

### Physical
- Enjoy long periods of free play
- Developing eye-hand coordination
- Enjoy small group cooperative games
- May require rest after high energy play
- Improved body coordination; yet still can fall easily

### Social-Emotional
- Eager to receive adult praise
- Enjoy dramatic play
- Eager to engage in new activities/adventures led by involved adult
- Eager to identify with older children
- Enjoy exploring new materials and equipment
- Can be easily frightened by novel or strange events
- Prefer play in small groups
- Like responsibilities they can handle
- Learning to cooperate with others, but may at times display selfish behavior

### Cognitive
- Understand language better than they speak
- Are interested in present; vague concepts of past/future
- Eager to learn
- Ask many questions
- Define things by their use
- Developing a sense of humor
- Communicate best within a small group of peers
- May need guidance of adult when starting a new task

---

## Middle Years Grades 2-3 (7-9 years)

### Physical
- Enthusiastic about games
- Experiencing improvement in both gross and fine motor skills
- Possess a high activity level
- Practice to master variations of movement for physical activities
- Enjoy games that allow for comparison of skills
- Enjoy games that allow for self-improvement

### Social-Emotional
- Have a strong drive toward independence
- Develop a strong sense of loyalty to friends
- Need to belong to a group
- Play with and are friends with same-sex peers
- Like to take on responsibility
- Live in a world of games, rituals and humor inhabited only by children
- Like to have a best friend
- Have a rigid sense of right and wrong
- Need help accepting peers who are different or left out of a group

### Cognitive
- Like to talk; use language to express feelings/tell stories
- Developing a sense of time
- Enjoy collecting things
- Enjoy problem-solving games like treasure hunts
- Can plan and carry out projects with adult support
- Becoming more self-directed in activities
- Better able to understand and appreciate differences of opinion

---

## Pre- Adolescent Years Grades 4-6 (10-12 years)

### Physical
- May be careless about their clothes, room and body cleanliness
- Girls may have sudden growth spurt and beginning signs of puberty
- Enjoy physical activities that master specific skills
- Enjoy competitive games
- Possess a high activity level
- Enjoy games that allow for comparison of skills
- Enjoy games that allow for self-improvement

### Social-Emotional
- Enjoy small, peer-dominated group discussions
- Like to join organized groups
- Are anxious to grow up
- Are intensely loyal to their peer group
- Form a close one-on-one friendship
- Have a growing desire to assert individuality and independence
- Can be daring and competitive
- Can be critical of peers and adults
- Are self-conscious of their abilities

### Cognitive
- Ask many questions and want thoughtful answers
- Can often understand other points of view
- Developing strong interests, hobbies and collections
- Engage in daydreaming
- Enjoy problem-solving games and puzzles, etc.
- Enjoy rule-based games
- Are beginning to develop view about social/global issues
- Beginning to enjoy humor by telling jokes and understanding sarcasm.

---

## Early Teens Grades 7-8 (13-14 years)

### Physical
- May appear awkward as result of rapid physical growth
- Experiencing the beginning of puberty
- Differ greatly in rate of maturation
- Need to become familiar with changing body with strong drives
- Tend to tire easily
- Have a high activity level and appetite
- Enjoy cooperative games and competitive sports

### Social-Emotional
- Sensitive to their appearance
- Establishing a personal moral code
- Unsure of their place in society
- Depend on their peer group to develop identity
- Critical of their parents and home
- May adopt extremes and fads in clothing, speech, handwriting and mannerisms
- Form close one-to-one friendships
- Enjoy small, peer-dominated group discussions
- Have a strong desire to assert individuality and independence

### Cognitive
- Capable of high level of abstract thought
- Beginning to think about their future life roles
- Need time and freedom to engage in self-reflection
- Are able to postpone gratification
- Can plan ahead and organize tasks with little or no guidance from adults
- Beginning to develop views about social issues
FACILITATOR RESOURCE 5.1

KNOW YOUR LEARNERS
Age Group Characteristics
0 – 4 year olds (Preschool)

1. Review age group characteristics on the handout.
2. Read the activity so that you have a brief understanding of the main concepts and the procedure.
3. Think about how you would actually teach the lesson to the group as if they were the age group you are learning about. If there is time, teach a shortened version of the lesson.
4. Describe why this lesson is appropriate for this age group.

KNOW YOUR LEARNERS
Age Group Characteristics
5 - 7 year olds (Lower elementary K - 3)

1. Review age group characteristics on the handout.
2. Read the activity so that you have a brief understanding of the main concepts and the procedure.
3. Think about how you would actually teach the lesson to the group as if they were the age group you are learning about. If there is time, teach a shortened version of the lesson.
4. Describe why this lesson is appropriate for this age group.

KNOW YOUR LEARNERS
Age Group Characteristics
7 - 12 year olds (upper elementary)

1. Review age group characteristics on the handout.
2. Read the activity so that you have a brief understanding of the main concepts and the procedure.
3. Think about how you would actually teach the lesson to the group as if they were the age group you are learning about. If there is time, teach a shortened version of the lesson.
4. Describe why this lesson is appropriate for this age group.
KNOW YOUR LEARNERS
Age Group Characteristics
12 - 15 year olds (junior high)

1. Review age group characteristics on the handout.
2. Read the activity so that you have a brief understanding of the main concepts and the procedure.
3. Think about how you would actually teach the lesson to the group as if they were the age group you are learning about. If there is time, teach a shortened version of the lesson.
4. Describe why this lesson is appropriate for this age group.

KNOW YOUR LEARNERS
Age Group Characteristics
16 and older (high school/adult)

1. Review age group characteristics on the handout.
2. Read the activity so that you have a brief understanding of the main concepts and the procedure.
3. Think about how you would actually teach the lesson to the group as if they were the age group you are learning about. If there is time, teach a shortened version of the lesson.
4. Describe why this lesson is appropriate for this age group.
SECTION VI
CLOSING THE LOOP OF LEARNING: ASSESSMENT

What is the point of teaching if you don’t know if you have made a difference in what the learner knows, can do or feels? This section will introduce creating objectives for learning and will present various methods of formal and nonformal assessment.

Materials Needed:
White board or easel paper

Estimated Time: 30 Minutes

Creating Objectives

Purpose: To demonstrate the importance of clear, well-written objectives. Participants will be introduced to Revised Bloom’s Taxonomy and will practice writing their own objectives.

1. Explain to participants the importance of clearly defining the objectives of a program. What sort of experience do we want to provide? What do we want participants to take away or retain when they leave our programs? Writing clear objectives for your program can often be the most useful part of developing a lesson. It serves as the backbone for the teaching methods you will use and will guide the content you relate to the students. In order to assess learner outcomes or program goals, educators need to be able to write objectives in a way that clearly describes learning outcomes.

2. Revised Bloom’s Taxonomy is often used to write objectives. To help participants understand the progression of learning and to describe learner outcomes, introduce Revised Bloom’s Taxonomy (Reading 6.1). Explain that this list can be used to make it easier to assess lessons since the behavior is described in terms of outcomes. Environmental educators should strive to reach higher levels of thinking and learning in their lessons. Revised Bloom’s Taxonomy was used to write the Essential Standards for the N.C. Department of Public Instruction, so this will also be a helpful tool for those trying to work with public school groups.

3. Writing Objectives- Explain the difference between goals and objectives. Goals can be general statements of what you want students to get out of your program. Objectives are specific and measurable. The chart on Worksheet 6.1 may help clarify this for the participants. Create one or two environmental education objectives as a group, and then have the participants practice writing their own objectives on Worksheet 6.1. Tell them to write an objective for their 5E lesson or they can use the lesson they modified for the Know Your Learner activity.
Assessment
Purpose: To introduce different ways of assessing learners for both formal and non-formal educators.

1. Begin with a discussion about “why and when to assess?” Tests are just one way to assess student learning. There are many other ways to assess that lend themselves to environmental education and nonformal as well as formal education settings.

2. The list and the chart below (Figure 6.1) will help you guide a discussion about the variety of places and reasons for assessment. Guide a discussion as you build a chart, similar to the one below, on the board or on a piece of chart paper. Some reasons for assessment include:

1. To find out what students know about the environment, what they understand and what they can do.
2. To find out what students do not know, do not understand and cannot do.
3. To provide a basis for feedback to learners to help them in their environmental education.
4. To motivate learners to learn about the environment and from the environment.
5. To motivate environmental educators.
6. To support teaching and learning in environmental education.
7. To monitor and control standards in environmental education through certification.
8. To act as a measure for the accountability of environmental educators.
9. To raise educational standards in environmental awareness, understanding and action.
10. To improve environmental curricula.
11. To see whether learning objectives in environmental education are being met.
12. To rank students by level of environmental learning.
13. To diagnose environmental learning problems and needs.
14. To screen students who may not be environmentally aware or active.
15. To provide parents and others with information about the environmental learning of children.
16. To predict likely future environmental attitudes and actions of students.
17. To evaluate program goals and objectives.

Figure 6.1

<table>
<thead>
<tr>
<th>Figure 6.1</th>
<th>Diagnostic</th>
<th>Formative</th>
<th>Summative</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>When?</strong></td>
<td>Before teaching</td>
<td>During teaching</td>
<td>After teaching</td>
</tr>
</tbody>
</table>
| **Why?**   | • Assess needs and prior knowledge  
            • Prove for incorrect theories or misconceptions  
            • Match student need with teaching methods  
            • Continue diagnostic assessment  
            • Determine current levels of learning  
            • Determine what students need to succeed  
            • Modify teaching of concepts  
            • Provide immediate feedback  
            • Assess retention and understanding  
            • Assess changes in conceptual understanding  
            • Assess how much a student has learned  
            • Provide summative feedback to learner |
3. Remind the participants that having good objectives will help guide assessment. You don’t want to assess for something that isn’t part of your program goals or objectives. Also emphasize that assessment can have many forms—not just the traditional test that we associate with classroom learning. Have participants review Worksheet 6.2 and discuss which forms of assessment would be appropriate for the participants’ various educational settings and fields. If time allows, have a participant volunteer to do an informal assessment she or he already uses on the workshop participants (assessing what they have learned in the workshop so far).

Emphasize that the concept of “dipsticking” may be very effective in environmental education situations. Dipsticking is a term that was created by the famous educator Madeline Hunter, based on the idea of periodically checking a vehicle’s oil. Broadly, it refers to frequently checking with students during instruction to see if they are understanding the material. Explain that it is a form of formative assessment, meaning it is conducted during the educational activity, rather than after it is completed (a summative assessment). More specifically, according to Hunter’s model, dipsticking should include:

- Checking students frequently during the lesson
- Checking broadly, as many students as possible, simultaneously
- Checking on the same concept or topic
- Checking during instruction

Have the participants answer the questions at the end of the worksheet and have a group discussion.

(Dipsticking information from Classroom Assessment of Young Learners, L. Levine http://www.ifayed.net/Main_Folders/Resources/SPEER_02/TEARSCH1.PDF)

4. S.M.A.R.T Objectives. Refer the participants to Worksheet 6.3. Tell them that some environmental educators find the SMART model to also be helpful when developing objectives. The SMART model is actually used by businesses, organizations and government, but can also be applied to educational objectives. Have participants write their own S.M.A.R.T objective and have a few of them share with the group.

5. Program Evaluation- Tell the participants that assessment works both ways—an effective environmental educator also needs to evaluate programs, classes and workshops. This can be a very important aspect for improving your program. It can also be useful for collecting data that can be used in research projects or to share with your funders and/or board members. Explain that we will not cover program evaluation in MOTEE, as it could be an entire workshop in itself! However, there are many books and resources on the topic available. Share with them that the University of Wisconsin at Stevens Point offers a good online course for environmental educators in program evaluation: http://meera.snre.umich.edu/links-resources/evaluation-courses

6. In addition, the North American Association of Environmental Education has a series called Guidelines for Excellence for Environmental Education Programs. They have developed a series of learning strands that can be used to evaluate programs, Reading 6.2. Explain to the participants that NAAEE has several Guidelines publications, and that those in the nonformal area would benefit from review of the Nonformal EE Programs publication as well as the PreK-12 publication. Another good resource book to mention is Conducting Meaningful Interpretation: A Field Guide for Success by Ward and Wilkinson. Direct them to the online appendix for further resources on program assessment.
**READING 6.1**  
**Revised Bloom’s Taxonomy**

| Cognitive Process Dimensions: | 
|---|---|
| Remembering | Recognizing or recalling knowledge from memory. Remembering is when memory is used to produce or retrieve definitions, facts, or lists, or to recite previously learned information. |
| Understanding | Constructing meaning from different types of functions be they written or graphic messages or activities like interpreting, exemplifying, classifying, summarizing, inferring, comparing, or explaining. |
| Applying | Carrying out or using a procedure through executing, or implementing. Applying relates to or refers to situations where learned material is used through products like models, presentations, interviews or simulations. |
| Analyzing | Breaking materials or concepts into parts, determining how the parts relate to one another or how they interrelate, or how the parts relate to an overall structure or purpose. Mental actions included in this function are differentiating, organizing, and attributing, as well as being able to distinguish between the components or parts. When one is analyzing, he/she can illustrate this mental function by creating spreadsheets, surveys, charts, or diagrams, or graphic representations. |
| Evaluating | Making judgments based on criteria and standards through checking and critiquing. Critiques, recommendations, and reports are some of the products that can be created to demonstrate the processes of evaluation. In the newer taxonomy, evaluating comes before creating as it is often a necessary part of the precursory behavior before one creates something. |
| Creating | Putting elements together to form a coherent or functional whole; reorganizing elements into a new pattern or structure through generating, planning, or producing. Creating requires users to put parts together in a new way, or synthesize parts into something new and different creating a new form or product. This process is the most difficult mental function in the new taxonomy. |

</tr>
</tbody>
</table>

**Objectives:**

Review the objectives below and then practice writing your own learning objective for the lesson you created for the 5E Lesson in **Section IV**. Remember, objectives should be specific and measurable. Use the learning outcome verbs from Bloom’s Taxonomy.

1. Students will be able to describe three characteristics of a longleaf pine ecosystem.

2. Students will be able to identify four different trees by using tree identification techniques.

Write your own objective(s) for your 5E Lesson Plan:
WORKSHEET 6.2 -
Types of Assessment

Assessment is an essential element of teaching a good class or managing a good educational program. You may be most familiar with tests that occur after a lesson. A traditional classroom post-test would be a type of **formal assessment**. It is also **summative**, meaning it is done after the activity or class has occurred. Formal and summative assessments are useful, but in environmental education settings, you may find that **nonformal** and **formative** assessments are also essential for success.

**Formal/Conventional Assessment:** Most conventional tests have limited ability to measure certain skills and thinking abilities students have gained. Nonetheless, they can be an important component of assessment because they can be quickly and easily administered.

- Completion Items
- Multiple Choice
- Short Answer
- Pre- and Post- Tests

**Alternative or Informal Assessments:** These assessments are generally carried out while students are engaged in learning. An assessment done during the educational activity is a **formative** assessment. Some can be easily administered in a short period of time with learners, while others require a more extended engagement. One technique that lends itself well to environmental education situations is called “**dipsticking**.” Broadly, it refers to frequently checking with students during instruction to see if they are understanding the material. More specifically, according to famous educator Madeline Hunter’s model, dipsticking should include:

- Checking students frequently during the lesson
- Checking broadly, as many students as possible, simultaneously
- Checking on the same concept or topic
- Checking during instruction

An easy way to “dipstick,” especially while outdoors, is to use signals such as thumbs up or thumbs down to gauge if students understand a concept. This may be more orderly than asking questions, as it gauges the whole group and allows all to give input. In an indoor setting, students could use color coded cards, or cards with symbols, such as “yes/no” or “true/false” that they display when asked a question. Or, for example, you could quiz students on native versus nonnative plants, having them hold up one finger for native and two fingers for non-native, etc.

**Here are some other nonformal forms of assessment:**
- Games: Jeopardy or other fact-questioning games
- Questioning: A lot can be learned about what your students know and how far they have come by simply engaging them in questioning. Rather than telling them the answers and lecturing, try and draw out their knowledge by questions that lead to conceptual understanding. Make sure to allow plenty of wait time (at least 3-5 seconds) from when you ask a question to when you solicit a response. You can continuously gauge their understanding by asking questions throughout the lesson. Use Bloom’s Taxonomy to prepare questions before the lesson.
• Action items/Skills Assessment: Laboratory practical, Field work /Collecting and Analyzing, Decision-making exercises, Role play, Simulation Games, Community or Civic Action Projects
• Oral Tests and Interviews: Student Presentations, Debates/Role Plays, Group Discussion
• Written: Essay, Report/Assignment, Journals, Individual or Group Research Project, Creative Writing
• Classroom Observation: This can include observations of student actions as they perform a task, conduct field work, or complete a lab. You may be able to determine student attitudes towards the environment through peer or group work observations.
• Self-evaluation profile: Ask students to evaluate their learning experience. They may surprise you with their level of honesty and candid portrayal.

1. Which of the assessments are better suited for non-formal vs. classroom settings? Which ones can you see being most useful to your teaching?

2. What are some ways that you can incorporate assessment into your teaching that you have not previously used? Describe a lesson and/or program in which you can add an assessment component.

3. Are there any other forms of assessment that you use that were not mentioned above? If so, please share with the group.
“SMART” Objectives strive to be Specific, Measurable, Achievable, Relevant, and Time-Oriented. This “formula” for the components of an objective may help you in crafting your own:

**Specific:** Expectations are clear and observable.

**Measurable:** The goal is realistic, can be attained and can be measured by a practical standard.

**Achievable:** While it should be rigorous and push the learner, it should still be realistic and age or skill appropriate.

**Relevant:** The behavior or skill should have a “real world” application or be relevant to established learning goals or standards.

**Time-oriented:** The objective should have a realistic timeframe or duration.

---

**Example of a SMART objective:**

By the end of the “Little Herpetologists” Camp for 2nd Grade, student participants will be able to identify 2 native herps and explain their life cycles.

This objective has a specific, observable expectation that can be measured by a formal or informal assessment. It is an achievable goal for that age group, is relevant to the 2nd grade Essential Standards for Science (ES 2.L.1 and ES 2.L.2) and is described for a specific timeframe.

---

1. Write your own S.M.A.R.T objective for your 5E lesson plan:
The National Project for Excellence in Environmental Education, initiated by The North American Association for Environmental Education (NAAEE) has developed a set of guidelines that can be used to structure and evaluate environmental education programs and materials. The guidelines can be viewed as national standards for environmental literacy.

The NAAEE Guidelines for Learning (K-12) are organized into four strands and provide a baseline for the knowledge and skills that students should have to be environmentally literate. These guidelines also stress age-appropriate topics. These strands are adapted from NAAEE’s Guidelines Learning (K-12):

1. **Questioning, Analysis and Interpretation Skills**
   Learners should be able to ask questions, speculate and hypothesize about the world around them, seek information and develop answers to their questions. Learners should be familiar with inquiry, master fundamental skills for gathering and organizing information, and how to interpret and synthesize information to develop and communicate explanations.

2. **Knowledge of Environmental Processes and Systems**
   Learners should understand the processes and systems that constitute the environment, including human social systems and influences. That understanding is based on knowledge synthesized from across traditional disciplines and includes a base knowledge of the earth as a physical system, the living environment, humans and their societies, and the relationship between environment and society.

3. **Skills for Understanding and Addressing Environmental Issues**
   Skills and knowledge are refined and applied in the context of real-life environmental issues where differing viewpoints about environmental problems and their potential solutions are played out. Environmental literacy includes the abilities to define, learn about, evaluate and act on environmental issues and requires that students possess skills for analyzing and investigating environmental issues and decision-making and citizenship skills.

4. **Personal and Civic Responsibility**
   Environmental literate citizens are willing and able to act on their own conclusions about what should be done to ensure environmental quality while balancing cultural, economic and other concerns. Learners understand that what they do individually and in groups can make a difference.

The NAAEE guidelines can be ordered from their website, [http://www.naaee.net/publications](http://www.naaee.net/publications)
SECTION VII
CORRELATING TO THE NORTH CAROLINA ESSENTIAL STANDARDS

In this Section you and the participants will be introduced to the importance of using the North Carolina Essential Standards. Participants will practice by correlating their 5E lesson plans to the Essential Standards.

Materials Needed:
Laptop connected to the Internet and projector, if possible. Four to five copies of the Essential Standards for Science for K-2, 3-5, 6-8, Earth/Environmental

Purpose: To introduce the N.C. Essential Standards and point participants to resources to learn more about the standards. Participants will practice correlating their 5E lesson plans to the essential standards for science.

1. Begin with a discussion about the importance of correlating programs to the North Carolina Essential Standards, especially if they will be providing environmental education programs, field trips, etc. for public school groups and/or school-aged children. Let participants know that even if they will not be working with school-aged children, understanding the essential standards and how they relate to environmental education is still important information, as it has a major effect on environmental education policy in our state.

   • The North Carolina Essential Standards can be found on the Department of Public Instruction’s Accountability and Curriculum Reform Effort (ACRE) website at http://www.ncpublicschools.org/acre/standards/.
   If possible show the website and how to move around in it.
   • Background information to share: Classroom teachers must meet state mandated standards for each grade level and subject taught. The standards give the accepted level of knowledge that students need to meet by the end of the school year. Teachers are VERY concerned about teaching to the standards. If we can show how environmental education will assist public school teachers in meeting the standards they are more likely to participate.
2. Show the N.C. Essential Standards for science on the Internet, and have copies of the standards for science available for the following: K-2, 3-5, 6-8, Earth/Environmental (4-5 copies of each, depending on the number of groups).

3. Lead a brief discussion on correlating environmental education programs to the standards. Rely on the formal educators in your group to assist in the discussion.
   - Have you ever heard of the standards?
   - Do you know a teacher in your area that can help you make connections?
   - Ask any teachers to describe how they correlate lessons to state standards.

4. Divide the participants into groups of 2-4. Try to mix formal and non-formal educators as much as possible if both are represented among the participants. Give each group copies of the essential standards and allow them a few minutes to skim through them. Tell the participants that while we are using the Essential Standards for Science, environmental education programs can be correlated to many other subject areas as well, such as social studies, math, art, language arts and more.

5. Next, tell participants that they will work together to correlate their 5E lessons to the standard course of study. If time allows, each group should work together to correlate each of their 5E lessons to at least one Essential Standard. Have them review Reading 7.1, A Guide to Correlating Non-Formal EE Programming in NC, by Sarah Ludwig. Note that Sarah wrote this helpful guide in cooperation with several NC environmental educators and that it was reviewed by N.C. Department of Public Instruction Science Curriculum Consultants. Also note that N.C. DPI has a resource that further explains the standards available on their website. Show them the example of Unpacked Content, Reading 7.2. After they are finished, have each group share one of their correlations and allow participants to discuss any questions they have about correlating to the standards.

6. As mentioned in the previous chapter, the North American Association for Environmental Education (NAAEE) has also developed standards related to the competencies that they feel students should be reaching in environmental education programs. Many environmental education programs in the state, including the N.C. Office of Environmental Education and Public Affairs, also follow the NAAEE guidelines in designing programs. They may be useful in developing programs where the Essential Standards would not apply, such as programs for adults. A summary of the guidelines is on Reading 6.3 in the previous chapter. Tell the participants that the complete guidelines can be ordered from NAAEE, and there is more information in the online appendix.

Other resources for the North Carolina Essential Standards for science can be found on the Department of Public Instruction’s Science Wiki at http://scnces.ncdpi.wikispaces.net
READING 7.1 -

A Guide to Correlating Non-Formal EE Programming in NC

WHY CORRELATE NON-FORMAL PROGRAMMING?

Non-formal environmental education programs offer enriching hands-on learning experiences often at little cost, but it is difficult for teachers to gain field trip or guest speaker approval without attaching documentation of what is going to take place during the program or demonstrating clear alignment to the standards. Thus, correlations help non-formal programs gain credibility with local schools, offer teachers suggestions for age-appropriate programming, ensure programs have developmentally appropriate content, and provide support and equal access for all interested groups. In order to continue to attract and partner with public formal educators, EE must adapt to standards-based education.

WHAT ARE THE STANDARDS IN NORTH CAROLINA?

The NC Essential Standards - NC specific standards for all other subjects (i.e. science, social studies, arts education, healthful living, etc.). Taught and assessed beginning in 2012-2013. Testing for science begins in 5th grade — [http://www.ncpublicschools.org/acre/standards/new-standards/](http://www.ncpublicschools.org/acre/standards/new-standards/)

For more helpful terminology relevant to NC public schools, see a full list of DPI acronyms here: [http://www.ncpublicschools.org/acronyms/](http://www.ncpublicschools.org/acronyms/)

HELPFUL RESOURCES

If you have previously correlated to the NC Standard Course of Study, these crosswalks [http://bit.ly/Top4Kse](http://bit.ly/Top4Kse) can help facilitate connections to the new standards.

For the NC Essential Standards in Science, this page [http://bit.ly/1eU8GAH](http://bit.ly/1eU8GAH) on the DPI Science Wiki has many resources:

- an Excel spreadsheet of all K-12 science standards organized by strand, to see all the science standards at once
- a glossary explaining key terms, making it easier to incorporate these terms into your programs
- the unpacked content documents for each grade, explaining in more detail and depth each Essential Standard
- And more!

Unpacked content documents for all subjects in the NC Essential Standards can be found here [http://bit.ly/1fZ8bVX](http://bit.ly/1fZ8bVX)

86
THE PROCESS

1. **Make a plan and familiarize yourself**
   - Construct a team. Ideally, the staff members who most frequently do the program should do the correlations. Designate others as levels of review to check accuracy. If possible, involve local teachers, who already have a working knowledge of the standards. Set a timeline.
   - Start with only a few programs, perhaps those that are mostly frequently requested. Know exactly how these programs are executed, so that they are replicable by any program staff member. Correlations should be based on what is consistently done every time the program is run.
   - Read through the standards with your programs in mind. Delve further into the standards by familiarizing yourself with other resources from the Dept. of Public Instruction (DPI) (refer back to the “Helpful Resources” section).

2. **Correlate!**
   - Move systematically through the relevant standards for each program, one program at a time. Look at the standards and your program description simultaneously, swapping back and forth to compare. Keep good records in Microsoft Excel or Word.
   - Don’t limit yourself to only one area of the curriculum; the NC Essential Standards for Social Studies contain a “Geography and Environmental Literacy” strand that is highly relevant to many EE programs.
   - Avoid stretching it! Use the “Unpacked Content” documents to ensure that you understand exactly what the standards mean and how your program fits.
   - Take your time and don’t be discouraged! It is a time-consuming process.

3. **Review, Synthesize, and Disseminate**
   - Verify the correlations are accurate through as many levels of review as feasible.
   - Add each program’s correlations to the program notes/script used by staff, providing a reminder of these goals each time the program is run.
   - Format an overview of the programs and their correlations that is easy to understand and also easily maintained. Although searchable databases are generally preferred, both tables and lists organized by grade/standard work well. Look at correlations by other EE organizations to get lots of great ideas!
   - Ensure teachers have access to the correlations, whether in print, online, or both.
   - Ask for feedback!

4. **Move beyond the standards**
   - Adjust programs to hit more grade levels or subjects (but only if it makes sense).
   - Offer pre- and post- activities for the classroom that delve deeper into relevant topics, address additional standards, and/or ask test prep questions.

Compiled by Sarah Ludwig—with a huge thanks to all the educators who have been trailblazers for this process, especially Holly Denham, Dana Fitz-Simons, O’Neie Hefner, Kelly Hoke, Tanya Poole, Renee Strnad, Benita Tipton, Lisa Tolley, Jackie Tricket, and Sarah Yelton for the input and expertise that made this document possible.
### Ecosystems

<table>
<thead>
<tr>
<th>Essential Standard and Clarifying Objectives</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>5.L.2 Understand the interdependence of plants and animals with their ecosystem.</strong></td>
</tr>
<tr>
<td>5.L.2.1 Compare the characteristics of several common ecosystems, including estuaries and salt marshes, oceans, lakes and ponds, forests and grasslands.</td>
</tr>
<tr>
<td>5.L.2.2 Classify the organisms within an ecosystem according to the function they serve: producers, consumers, or decomposers (biotic factors).</td>
</tr>
<tr>
<td>5.L.2.3 Infer the effects that may result from the interconnected relationship of plants and animals to their ecosystem.</td>
</tr>

</table>

### Unpacking

What does this standard mean a child will know, understand and be able to do?

5.L.2.1 Students know that there are different types of ecosystems (terrestrial and aquatic). These ecosystems can be divided into two types according to their characteristics:

**Terrestrial**

Land-based ecosystems include forests and grasslands. *Forests* have many trees (with needles or with leaves), shrubs, grasses and ferns, and a variety of animals. They usually get more rain than grasslands. Diverse types of animals can be found in forests, depending on their type. Deciduous: black bear, deer, red fox, vole, rabbit, cardinal. *Rain forest*: panther, monkeys, capybara, snakes, spiders. Temperatures in the forests may vary depending on where the forest is located.

*Grasslands* have fertile soil and are covered with tall grasses. They usually get a medium amount of rain, but less than forests. Temperatures may also vary.
depending on where the grassland is located. Some examples of animals that live in the grasslands are prairie dogs, bison and grasshoppers.

Aquatic
Water-based ecosystems may be fresh water (lakes and ponds) or saltwater (oceans, estuaries and saltwater marshes).

Lakes and ponds are bodies of freshwater that are surrounded by land. Ponds are usually shallower than lakes and the temperature of the water usually stays the same from top to bottom. Plants and algae usually grow along the edges where the water is shallow. Some examples of animals may be different types of fish, amphibians, ducks, turtles or beavers.

Oceans are large bodies of saltwater divided by continents. Oceans have many types of ecosystems depending on the conditions (sunlight, temperature, depth, salinity) of that part of the ocean. Most organisms live where the ocean is shallow (from the shoreline of the continental shelf) because sunlight can reach deep and the water is warm making food abundant. Some examples of organisms that live in the shallow ocean are drifters (jellyfish or seaweed), swimmers (fish), crawlers (crabs), and those anchored to the ocean floor (corals). Some organisms live in the open ocean, near the surface or down to the deep ocean bottom. Plankton float in the upper regions of the water. Some organisms swim to the surface to find food or for air (whales, turtles, sharks) while others live closer to the bottom (certain fish, octopus, tubeworms). Students know typical visual representations of the various ecosystems, as well as graphic representations of the food chains and webs, cycles and energy pyramids that are commonly associated with ecosystems.

5.L.2.2.
Students know that organisms in an ecosystem can be producers, consumers, or decomposers. Students know that producers convert energy from the sun into organic matter through the process of photosynthesis. This organic matter is used by producers and consumers as a food source. Producers and consumers produce wastes as they perform their life processes, and become waste organic matter when they die. Decomposers use these waste materials and other non-living organic matter to fuel their life processes and recycle nutrients that are necessary for producers to carry out their life processes.

5.L.2.3
Students know that all of the organisms in an ecosystem have interconnected relationships. Students know that because of this, factors that impact one population within an ecosystem may impact other populations within that ecosystem.
SECTION VIII
REFLECTION

Estimated Time: 30 Minutes

Materials Needed:
4 signs from the Section II Learning Styles activity (Sensing/Feeling, Doing, Watching, Thinking)

One “sharing object” such as a story stick, smooth stone or other artifact. Something “serious” is recommended (not a toy or stuffed animal).

Purpose: This part of the workshop will provide a time for the participants to reflect on what they have gained from the workshop and will also provide an informal assessment of what they have learned.

1. For this activity, you will need to put the four signs from the Section II Learning Styles Activity back around the space. If the weather is nice, you may want to do this activity outside, but the participants may need chairs or at least a space to sit.

2. Ask the participants to move back into their learning styles groups from Section II (Accommodator, Diverger, Converger, Assimilator).

3. Ask the participants to think about the following questions for 2 minutes, and then share with their group for 2 minutes:
   a. What is one thing you learned from the workshop that you will use in your work?
   b. What did you learn that surprised you or made you “think outside the box” in relation to environmental education?
   c. Is there a topic that was covered that could use more in-depth exploration? Less?

4. Next, have the 4 groups form one large circle. Tell them that this circle represents many things. For one, it shows that all learning styles can blend and work together, which is essential for sound environmental education. It also represents the holistic and interdisciplinary nature of environmental education. Just like the cycles of nature, environmental education is a continuous cycle of discovery and inquiry.

5. Tell the group that they will now each share an “Aha” moment that happened to them during the workshop. Tell them that an Aha moment has been defined as “a moment of sudden realization, inspiration, insight, recognition, or comprehension.”

6. Give them a moment for some of the group to form their idea. Tell them to limit their statement to one or two sentences. Tell them they will take turns sharing their moment by passing the “sharing object” you chose. You can have them take turns, skipping those that are not ready or just pass the object randomly as long as the circle is not too large. If you think it is appropriate, share your “Aha” moment as well.
