25 Yrs of Beachfront Management Act in South Carolina: 
Ebbs and Flows of the shoreline, structures and development

Paul T. Gayes

NC Coastal Commission  February 11, 2009  
Beaufort, NC
Large Range in Morphology and Dominant Processes
Four Zones defined by morphology/processes and development
Consider recent history at Cape Hatteras.
Hunting Island
Fripp Island
Like Most Coastal States South Carolina Has Developed Increasingly Massive and Static Infrastructure Advancing Towards a Migrating Shoreline
South Carolina Coastal Zone Management

1977-1988

- Limited jurisdiction
- Critical line set at the scarp line, or at the landward toe of the primary dune
- No jurisdiction landward of this line
- Seawalls routinely permitted

Myrtle Beach 1992

A Significant Percentage of the South Carolina Coast Remains Undeveloped
Distribution of Groins in SC
Distribution of Groins-Seawalls-Bulkheads-Revetments-Riprap in SC
1987 South Carolina Blue Ribbon Committee on Beachfront Management

• Appointed by Coastal Council in 1987
  25 members: gov’t, private, academic
  Asked to propose long-term solutions to beach erosion issues; balance public/private interests
  Found ~ 57 miles “critically eroding”

Recommended changes to the 1977 SC Coastal Tidelands and Wetlands Act

➢ 1988 Beachfront Management Act
1987 South Carolina Blue Ribbon Committee on Beachfront Management

- **Consensus on threats to:**
  - Beach/dune existence
  - Life and property
  - Tourism industry/coastal economy
  - Coastal/marine habitats

- **“Findings of Fact:”**
  - Sea level rise “scientifically documented,” and may increase
  - Armoring “has not proven effective”
  - “Retreat” is best long-term strategy
1988 Beachfront Management Act (BMA)

- Implemented recommendations of the Blue Ribbon Committee
- Created two new lines of jurisdiction
- Baseline methodology for standard zones (natural and armored), and inlet zones (stabilized and unstabilized)
- Setback line dependent on erosion rate
- Landward most position of the shoreline in 40 yrs
- Eroded vegetation line on aerial photos

**INLET HAZARD ZONES**

- Crest of the Primary Dune
- Defined - Beach Surveys
- Shore parallel contours

**STANDARD ZONES**
Armored / Developed Shorelines

Washout Area Folly Beach, SC (1996) 3 years after nourishment

Jurisdictional Line Based on Volume and Morphology Rather Than a Shoreline
• Baseline updated every 10 yrs.
• Long Term = Retreat Policy

Set-Back Line

40 x annual erosion rate

Base Line
1988 BMA Restrictions

- No construction seaward of the baseline
- No new seawalls
- Existing seawalls, if destroyed, could be replaced with sloping structures 10’ from the building foundation
- All vertical seawalls to be removed after 30 years, and replaced with sloping structures
Hurricane Hugo, 1989

Initial Challenges Natural

- Many destroyed houses rebuilt farther landward, behind the baseline (Urban/suburban renewal)
- Destroyed seawalls replaced with sloping structures 10’ from building foundation
1989 Lucas Lawsuit
Early Legal Challenges

- Lucas lots were totally seaward of the baseline, unbuildable under 1988 BMA
- Lucas sued, claiming a taking
- Case went to US Supreme Court, which ruled in his favor in 1992 and remanded the case for damages
1990 Revisions to BMA

- Construction seaward of the baseline could now be authorized under a “special” permit
  - No larger than largest, never >5,000 s.f.
  - As far landward as practical, no farther seaward than neighboring houses
  - Never on primary dune or active beach
  - No seawall as part of foundation
  - If the house is ever located on the active beach, it must be removed*

- Destroyed seawalls could not be rebuilt

- DBR threshold at 80% in 1990, 66 2/3% in 1995, 50% in 2005

- 30-year time limit on vertical walls eliminated
While courts were determining damages, settled out of court

- State issued 2 special permits to Lucas
- State purchased lots for $425k each, plus $725k awarded ($1.575M total)
- State sold lots, transferred permits
- Lots were built on in 1995 and 1998
South Carolina State Policy Remains

Essentially a Retreat Policy

Some tightening – Seawall Provision
Some Loosening- Special Permit

In Practice... Implementation and Associated Thorny Issues... Delayed by Extensive Beach Nourishment....

“Mid-term Solution...to Long Term Issue”
## South Carolina Beach Nourishment 1990-2008

**21 Projects** 1990-2008 96.2 $194,150,000 27,700,000
At Present In South Carolina....Existing groins may be reconstructed, repaired, and maintained.

New groins may only be allowed on beaches that have high erosion rates with erosion threatening existing development or public parks.

(this is an issue for us-emergency orders etc.)
In addition to these requirements, new groins may be constructed and existing groins may be reconstructed only in furtherance of an on-going beach renourishment effort which meets the criteria set forth in R.30-14(G), and in accordance with the following:

(a) The applicant shall institute a monitoring program for the life of the project to measure beach profiles along the groin area and adjacent and downdrift beach areas sufficient to determine erosion/accretion rates. For the first five years of the project, the monitoring program must include, but is not necessarily limited to:

(i) establishment of new monuments;
(ii) determination of the annual volume and transport of sand; and
(iii) annual aerial photographs.

Subsequent monitoring requirements must be based on results from the first five-year report.
(b) Groins may only be permitted after thorough analysis demonstrates that the groin will not cause a detrimental effect on adjacent/downdrift areas. The applicant shall provide a financially binding commitment, such as a performance bond or letter of credit that is reasonably estimated to cover the cost of reconstructing or removing the groin and/or restoring the affected beach through renourishment pursuant to subsection (c).

(c) If the monitoring program established pursuant to subsection (a) shows an increased erosion rate along adjacent or downdrift beaches that is attributable to a groin, the department must require either that the groin be reconfigured so that the erosion rate on the affected beach does not exceed the pre-construction rate, that the groin be removed, and/or that the beach adversely affected by the groin be restored through renourishment.
(d) Adjacent and downdrift communities and municipalities must be notified by the department of all applications for a groin project.

(e) An adjacent or downdrift property owner that claims a groin has caused or is causing an adverse impact shall notify the department of such impact. The department shall render an initial determination within sixty (60) days of such notification. Final agency action shall be rendered within twelve months of notification. An aggrieved party may appeal the decision pursuant to the Administrative Procedures Act.
(f) In an area in which new groins have been permitted, or in an area in which existing groins have been reconstructed or repaired, access along the beach from one groin compartment to another must be maintained or improved. If access is impacted or eliminated, temporary access around or over the groin must be established immediately. Within thirty days of notification from the Department, a plan to provide permanent access around or over the groin must be submitted by the entity responsible for the groin construction. This permanent access plan must be implemented within ninety days of the Department approval.

(g) The applicant must have written approval from the local government which has jurisdiction in the area where the project is proposed.

OCRM - Science and Policy

Shoreline Change Initiative

In 2007, DHEC-OCRM initiated a Shoreline Change Initiative to organize existing data collection and research efforts, identify additional research needs, and formulate policy options to guide the management of South Carolina’s estuarine and beachfront shorelines.

Shoreline Change Advisory Committee

The Shoreline Change Advisory Committee is an integral part of DHEC’s multi-year Shoreline Change Initiative. Comprised of a broad cross-section of coastal stakeholders, the committee will begin to organize existing shoreline research, identify research priority needs and explore policy options to ensure the long-term sustainability of our state’s coastal resources. The committee will meet regularly and conclude its business in late 2008. Public comment will be received at scheduled meetings at the beginning and end of the committee process. Written comments will be accepted on an ongoing basis.

Written comments may be submitted via email to davidsb@dhec.sc.gov or via surface mail to:

Brendan Davis, Ph.D.
DHEC-OCRM
1362 Meeting Ave.
Suite 400
Charleston, SC 29405

Background

Twenty years ago, a "blue ribbon panel" was convened by the former South Carolina Coastal Council (now SCDHEC-OCRM) to address what was considered at risk situation involving our beaches. Recognizing the threats of chronic erosion, gradual sea level rise, increased shoreline development, and a lack of comprehensive beach management planning and management, the panel developed recommendations that provided guidance to state regulators and legislators in developing beach management policies. Most of their recommendations were adopted into law through the Beachfront Management Act of 1987. Over the past two decades, the beachfront management act and associated regulations have significantly limited development and hard stabilization of the

Governor’s Climate Energy & Commerce Advisory Committee

Recommended a Panel be appointed by Legislature/Governor to:
consider potential adaptation strategies for the state to potential future climate change and sea level rise
“Unintended Consequences”
