Bedrock Geologic Map of the Henderson 7.5-minute Quadrangle, Vance County, North Carolina

By
David E. Blake and Edward F. Stoddard

North Carolina Department of Environmental Quality
Energy Group
Geological Survey Division

Disclaimer:
The N.C. Board of Geologist Examiners annually reviews the geologic maps and data issued by the N.C. Geological Survey. These maps and data are sold for the purpose of planning and not as a substitute for a professional geologist's opinion. The N.C. Geological Survey does not warrant the accuracy or the completeness of the maps or data provided. Use of these maps or data is at your own risk. The N.C. Geological Survey shall not be liable for any loss or damage caused by the use of these maps or data.

Explanatory Notes:
1. Shaded areas are locally known as "rocks" or "bedrock" in the Carolina Piedmont. These include igneous, metamorphic, and sedimentary rocks.
2. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
3. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
4. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
5. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
6. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
7. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
8. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
9. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
10. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
11. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
12. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
13. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
14. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
15. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
16. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
17. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
18. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
19. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
20. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
21. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
22. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
23. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
24. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
25. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
26. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
27. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
28. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
29. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
30. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
31. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
32. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
33. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
34. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
35. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
36. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
37. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
38. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
39. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
40. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
41. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
42. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
43. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
44. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
45. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
46. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
47. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
48. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
49. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
50. The shaded areas are the main rock types in the study area. They are classified based on their geological characteristics and mineral content.
51. The shaded areas are the general rock types found in the study area. They are classified based on their geological characteristics and mineral content.
