EXECUTIVE SUMMARY

The Brown Marsh Swamp Restoration Site (Site) is located one mile east of the North Carolina and South Carolina state line, and is approximately 15 miles southwest of the Town of Lumberton, in Robeson County. The Site is situated due east of the intersection of Cotton Valley Road and McCormick Road, approximately one mile south of Interstate 95. The Site is located within United States Geological Survey (USGS) Hydrologic Unit and Targeted Local Watershed 03040204037010 (North Carolina Division of Water Quality Subbasin 03-07-55) of the Lumber River Basin and will service the USGS 8-digit Cataloging Unit 03040204. The Site was identified to assist the North Carolina Ecosystem Enhancement Program in meeting its stream and wetland restoration goals.

Primary activities at the Site included 1) stream restoration, 2) wetland restoration, 3) soil scarification, and 4) plant community restoration. Project restoration efforts provided 5004 Stream Mitigation Units and 5.0 Nonriverine Wetland Mitigation Units.

Seventeen vegetation plots (10-10 meters by 10 meters and 7-20 meters by 5 meters in size) were established and permanently monumented. These plots were surveyed in August 2010 for the Year 3 (2010) monitoring season. Based on the number of stems counted, average densities were measured at 793 planted stems per acre surviving in Year 3 (2010). The dominant species identified at the Site were planted stems of silky dogwood (*Cornus amomum*), elm (*Ulmus* sp.), green ash (*Fraxinus pennsylvanica*), overcup oak (*Quercus lyrata*), cherrybark oak (*Quercus pagoda*), and swamp chestnut oak (*Quercus michauxii*), and natural recruits of red maple (*Acer rubrum*). No vegetation problem areas were noted during the Year 3 (2010) monitoring season.

Twenty cross-sections and longitudinal profiles within five 600-foot reaches were measured for the Year 3 (2010) monitoring season. As a whole, monitoring measurements indicate minimal changes in both the longitudinal profile and cross-sections as compared to as-built data. The channel geometry compares favorably with the emulated, stable E/C type stream reach as set forth in the detailed mitigation plan and as constructed. Current monitoring has demonstrated dimension, pattern, and profile were stable over the course of the monitoring period. No stream problem areas were noted during Year 3 (2010) monitoring.

Two onsite groundwater gauges and one reference groundwater gauge were maintained for the Year 3 (2010) monitoring season. Monitoring Gauge 2 was inundated/saturated within 12 inches of the surface for greater than 12.5 percent of the growing season while Gauge 1 was just shy of success criteria with inundation/saturation within 12 inches of the surface for 11.8 percent of the growing season. In addition, the reference gauge did not meet success criteria for the Year 3 (2010) monitoring season and rainfall was well-below normal for the month of April. No wetland problem areas were noted during Year 3 (2010) monitoring.

In summary, the Site achieved success criteria for vegetation, stream, and hydrology attributes in the Third Monitoring Year (2010).

1.0 PROJECT BACKGROUND

1.1 Location and Setting

The Site is located one mile east of the North Carolina and South Carolina state line, and approximately 3.2 miles southeast of the town of Rowland (Figure 1). The center of the Site has a latitude and longitude of 034° 29' 31.85" N and 079° 16' 26.87" W. The Site is situated due east of the intersection of Cotton Valley Road (SR 2492) and McCormick Road (SR 2491), approximately one mile south of Interstate 95. The Site is located within United States Geological Survey (USGS) Hydrologic Unit and Targeted Local Watershed 03040204037010 (North Carolina Division of Water Quality [NCDWQ] Subbasin 03-07-55) of the Lumber River Basin and will service the USGS 8-digit Cataloging Unit 03040204 (USGS 1974, NCWRP 2003). The Site was identified to assist the North Carolina Ecosystem Enhancement Program (EEP) in meeting its stream and wetland restoration goals.

Directions to the Site from Raleigh, North Carolina, are as follows:

- Take Interstate 40 East for approximately 18 miles to Interstate Highway 95 (I-95) South
- Take I-95 South for approximately 80 miles to Exit 2, North Carolina Highway 130 (NC-130)
- Take a left/travel south on NC-130 for approximately 0.1 mile to Cotton Valley Road (SR 2492) and turn right
- Follow Cotton Valley Road for approximately 2 miles
- The project is south of Cotton Valley Road and east of McCormick Road (SR 2491)

1.2 Project Objectives

The primary components of the restoration project included 1) construction of a stable, riffle-pool stream channel; 2) enhancement of water quality functions within, upstream, and downstream of the Site; 3) creation of a natural vegetated buffer along restored stream channels; 4) restoration of jurisdictional nonriverine wetlands in the Site; 5) improvement of aquatic habitat and species diversity by enhancing stream bed variability; and 6) restoration of wildlife functions associated with a riparian corridor/stable stream.

1.3 Project Structure, Restoration Type, and Approach

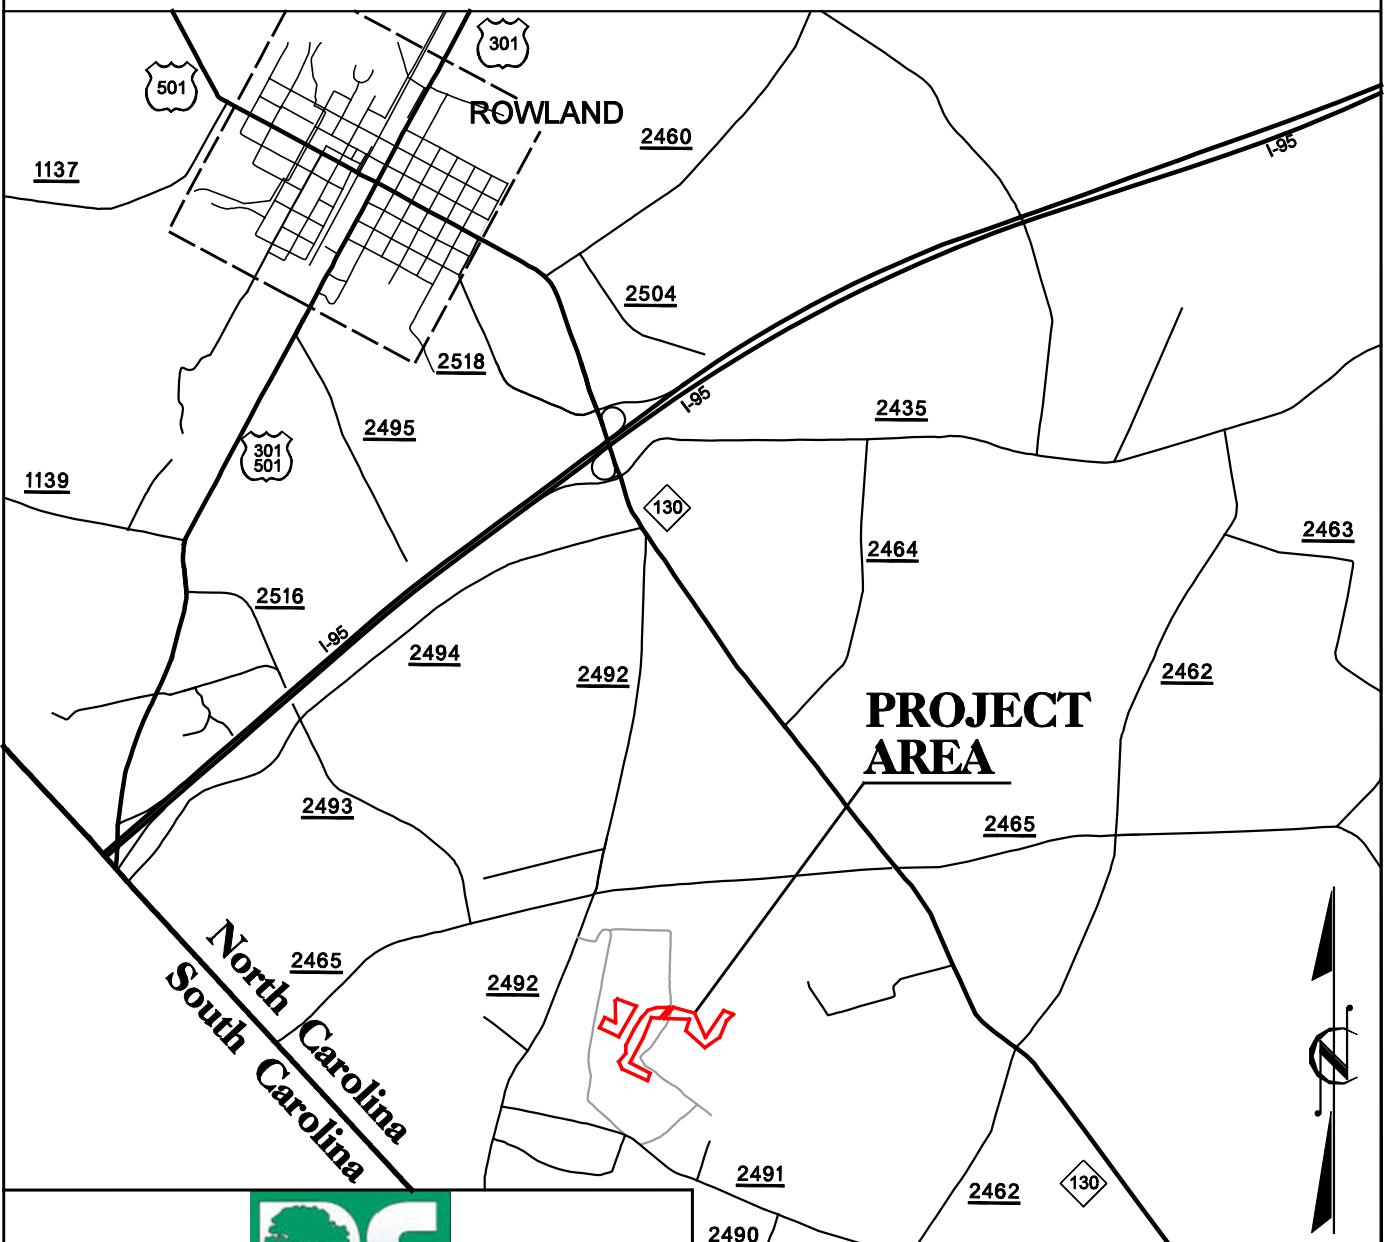

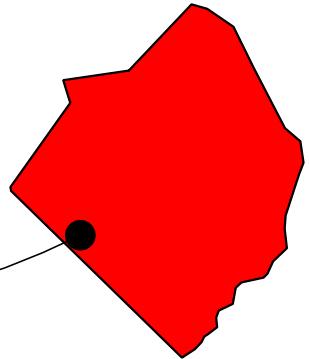

A 20.25-acre conservation easement has been placed on the Site to incorporate all restoration activities. The Site contains 5.0 acres of hydric soils, two first-order unnamed tributaries (UTs) to Contrary Swamp (Northern UT and Southern UT), associated floodplain, and upland slopes. The purpose of this project was to restore stable pattern, dimension, and profile to the UTs; restore hydrology to drained nonriverine wetlands; and revegetate streams, floodplains, wetlands, and upland slopes within the Site. The contributing watershed is characterized primarily by agricultural row crop production and pine plantation/forest land. Preproject Site conditions consisted of agricultural row crop production. Land use modifications including the removal of riparian vegetation, straightening and dredging of stream channels, and ditching of floodplain wetlands resulted in degraded water quality and unstable channel characteristics (stream entrenchment, erosion, and bank collapse).

The primary goals of this stream and wetland restoration project focused on improving water quality, decreasing floodwater levels, and restoring aquatic and riparian habitat. These goals were accomplished by:

Figure: 1

- Reducing nonpoint sources of pollution associated with agricultural land uses by providing a forested buffer adjacent to streams to treat surface runoff.
- Reestablishing stream stability and the capacity to transport watershed flows and sediment loads by restoring stable dimension, pattern, and profile.
- Promoting floodwater attenuation by;
 - excavating a floodplain at a new bankfull elevation;
 - restoring a secondary, entrenched tributary thereby reducing floodwater velocities within smaller catchment basins;
 - increasing storage capacity for floodwaters within the Site limits; and
 - revegetating floodplains to increase frictional resistance on floodwaters.
- Improving aquatic habitat by enhancing stream bed variability, restoring a riffle-pool complex, and by incorporating grade control/habitat structures.
- Providing wildlife habitat including a forested riparian corridor within an area highly dissected by agricultural land uses.

Primary activities at the Site included 1) stream restoration, 2) wetland restoration, 3) soil scarification, and 4) plant community restoration. Table 1 describes the Site restoration structures and objectives, which have provided 5004 Stream Mitigation Units (SMUs) and 5.0 Nonriverine Wetland Mitigation Units (WMUs).

- Restored 5004 linear feet of two unnamed tributaries to Contrary Swamp (Northern UT and Southern UT) by constructing moderately sinuous, E-type channels on new location.
- Restored 5.0 acres of nonriverine wetland within the interstream flat filling ditches, removing elevated spoil, thereby reestablishing historic water table elevations.
- Reforested approximately 20.05 acres of floodplain, stream bank, upland slopes, and nonriverine wetlands with native forest species.

1.5 Monitoring Plan View

Monitoring activities for the Site, including relevant structures and utilities, project features, specific project structures, and monitoring features are detailed in the monitoring plan view in Appendix D. Site features including vegetation, stream dimension (cross-sections), stream profile and pattern, wetland hydrology, and photographic documentation were monitored in Year 3 (2010).

2.0 PROJECT CONDITION AND MONITORING RESULTS

2.1 Vegetation Assessment

Following Site construction, seventeen plots (10-10 meters by 10 meters and 7-20 meters by 5 meters in size) were established and monumented with metal fence posts at all plot corners and PVC at each plot origin. Sampling was conducted as outlined in the *CVS-EEP Protocol for Recording Vegetation, Version 4.0* (Lee et al. 2006) (<http://cvs.bio.unc.edu/methods.htm>); results are included in Appendix A. The taxonomic standard for vegetation used for this document was *Flora of the Carolinas, Virginia, Georgia, and Surrounding Areas* (Weakley 2007). The locations of vegetation monitoring plots were placed to accurately represent the entire Site and are depicted on the monitoring plan view in Appendix D.

2.1.1 Vegetation Success Criteria

Success criteria have been established to verify that the vegetation component supports community elements necessary for forest development. Success criteria are dependent upon the density and growth of characteristic forest species. Additional success criteria are dependent upon density and growth of "Character Tree Species." Character Tree Species include planted species, species identified through visual inventory of an approved reference (relatively undisturbed) forest community used to orient the Site design, and appropriate community descriptions from *Classification of the Natural Communities of North Carolina* (Schafale and Weakley 1990) including Coastal Plain Small Stream Swamp and

Nonriverine Wet Hardwood Forest. All canopy tree species planted and identified in the reference forest will be utilized to define “Character Tree Species” as termed in the success criteria. Table 5 below outlines planted and reference forest species.

Table 5. Planted and Reference Forest Ecosystem

| Planted and Reference Forest Ecosystem Character Tree Species |
|--|
| Red maple (<i>Acer rubrum</i>) |
| Ironwood (<i>Carpinus caroliniana</i>) |
| Green ash (<i>Fraxinus pennsylvanica</i>) |
| American holly (<i>Ilex opaca</i>) |
| Sweetgum (<i>Liquidambar styraciflua</i>) |
| Tulip poplar (<i>Liriodendron tulipifera</i>) |
| Water tupelo (<i>Nyssa biflora</i>) |
| Laurel oak (<i>Quercus laurifolia</i>) |
| Swamp chestnut oak (<i>Quercus michauxii</i>) |
| Water oak (<i>Quercus nigra</i>) |
| American elm (<i>Ulmus americana</i>) |

Success criteria dictate that an average density of 320 stems per acre of Character Tree Species must be surviving in the first three monitoring years. Subsequently, 290 Character Tree Species per acre must be surviving in year 4 and 260 Character Tree Species per acre in year 5.

2.1.2 Vegetative Problem Areas

During Year 1 (2008) monitoring, vegetation sampling across the Site was above the required average density with 476 stems per acre of Character Tree Species surviving; however, five of the seventeen plots had low densities (plots 12 and 14-17). Approximately 5 acres of the Site with low densities of stem survival were replanted at a density of 680 stems per acre in early 2009 prior to Year 2 (2009) monitoring. These areas appear to be recovering well. No vegetation problem areas were noted during the Year 3 (2010) monitoring season.

2.2 Stream Assessment

Twenty permanent cross-sections within five 600-foot reaches were established after construction was completed. Measurements of each cross-section include points at all breaks in slope including top of bank, bankfull, and thalweg. Riffle cross-sections are classified using the Rosgen stream classification system. Longitudinal profile measurements of five 600-foot reaches include thalweg, water surface, and bankfull; with each measurement taken at the head of facets (i.e. riffle, run, pool, and glide) in addition to the maximum pool depth.

2.2.1 Stream Success Criteria

Success criteria for stream restoration will include 1) successful classification of the reach as a functioning stream system (Rosgen 1996) and 2) channel variables indicative of a stable stream system.

The channel configuration will be measured on an annual basis in order to track changes in channel geometry and profile. These data will be utilized to determine the success in restoring stream channel

stability. Specifically, the width-to-depth ratio should characterize an E-type or borderline E/C-type channel, bank-height ratios indicative of a stable or moderately unstable channel, and minimal changes in cross-sectional area, channel width, and/or bank erosion along the monitoring reach. In addition, channel abandonment and/or shoot cutoffs must not occur and sinuosity values must remain relatively constant. The field indicator of bankfull will be described in each monitoring year and indicated on a representative channel cross-section figure. If the stream channel is down-cutting or the channel width is enlarging due to bank erosion, additional bank or slope stabilization methods will be employed.

Stream substrate is not expected to coarsen over time; therefore, pebble counts are not proposed as part of the stream success criteria.

Visual assessment of in-stream structures will be conducted to determine if failure has occurred. Failure of a structure may be indicated by collapse of the structure, undermining of the structure, abandonment of the channel around the structure, and/or stream flow beneath the structure.

2.2.2 Bankfull Events

Documented bankfull events are included in the table below. Three bankfull event were documented to date during the Year 3 (2010) monitoring period for a total of seven bankfull events.

Table 6. Verification of Bankfull Events

| Date of Occurrence | Method | Photo (if available) |
|--------------------|---|----------------------|
| April 5, 2008 | A total of 3.73 inches of rain fell on April 5, 2008 as recorded by a nearby rain station in Lumberton* | -- |
| September 6, 2008 | A total of 4.6 inches of rain fell on September 5-6, 2008 as recorded by a nearby rain station in Lumberton* | See below |
| March 1, 2009 | A total of 2.0 inches of rain fell on February 28-March 1, 2009 as recorded by a nearby rain station in Lumberton*. In addition wrack was documented within the floodplain during a Site visit. | -- |
| November 11, 2009 | A total of 3.3 inches of rain fell on November 10-12, 2009 as recorded by a nearby rain station in Lumberton* resulting from Tropical Storm Ida | 1-2 |
| May 23, 2010 | A total of 2.7 inches of rain fell on May 22-24, 2010 as recorded by a nearby rain station in Lumberton*. | -- |
| July 27, 2010 | A total of 2.9 inches of rain fell on July 27, 2010 as recorded by a nearby rain station in Lumberton*. | -- |
| September 27, 2010 | A 7.7-inch* rainfall event occurring between September 26-30, 2010 as recorded by a nearby rain station in Lumberton*. | -- |

*Weather Underground 2010

2.2.3 Stream Problem Areas

No stream problem areas were documented within the Site during the Year 3 (2010) monitoring period.

2.2.4 Categorical Stream Feature Visual Stability Assessment

Each stream reach was visually inspected during the Year 3 (2010) monitoring period using eight feature categories and various metrics within each category. Assessment features included riffles, pools, thalweg, meanders, channel bed, structures, and root wads/boulders. Tables for semi-quantitative assessments of each reach are included in Appendix B (Tables B1-B5). The mean percentage of performance for features within each reach are summarized in the tables below.

Table 7A. Categorical Stream Feature Visual Stability Assessment: Brown Marsh (Reach 1)

| Feature | Year 1 (2008) | Year 2 (2009) | Year 3 (2010) | Year 4 (2011) | Year 5 (2012) |

2.2.5 Quantitative Stream Measurements

During the Year 3 (2010) monitoring period 20 cross-sections and longitudinal profiles within five 600-foot reaches were measured. Permanent cross-sections and longitudinal profiles are included in Appendix B; each is graphically depicted for as-built through Year 3 (2010) for analysis. The stream channel did not have flowing water during Year 3 (2010) stream measurements; therefore, water surface slopes could not be calculated. As a whole, monitoring measurements indicate minimal changes in both the longitudinal profile and cross-sections as compared to as-built data. The channel geometry compares favorably with the emulated, stable E/C type stream reach as set forth in the detailed mitigation plan and as constructed. Current monitoring has demonstrated dimension, pattern, and profile were stable over the course of the monitoring period. Tables for quantitative assessments are included below; these tables include data from previous years.

2.3 Wetland Assessment

Two groundwater monitoring gauges and one reference groundwater gauge were maintained and monitored throughout the Year 3 (2010) growing season. Graphs of groundwater hydrology and precipitation from a nearby rain station (Weather Underground 2010) are included in Appendix C.

2.3.1 Wetland Success Criteria

Target hydrological characteristics include saturation or inundation for at least 12.5 percent within Trebloc soils (nonriverine wetlands) of the growing season, during average climatic conditions. This value is based on DRAINMOD simulations for 62 years of rainfall data in an old field stage. These areas are expected to support hydrophytic vegetation. If wetland parameters are marginal a jurisdictional determination will be performed for vegetation and soils in these areas (Environmental Laboratory 1987).

2.3.2 Wetland Problem Areas

No wetland problem areas were identified within the Site during Year 3 (2010) monitoring.

2.3.3 Wetland Criteria Attainment

Monitoring Gauge 2 was inundated/saturated within 12 inches of the surface for greater than 12.5 percent of the growing season while Gauge 1 was just shy of success criteria with inundation/saturation within 12 inches of the surface for 11.8 percent of the growing season. In addition, the reference gauge did not meet success criteria for the Year 3 (2010) monitoring season and rainfall was well-below normal for the month of April (Table 10 and Figure C1, Appendix C). Hydrographs containing groundwater and precipitation data for each gauge can be found in Appendix C in addition to a graph depicting annual rainfall at the Lumberton Airport versus 30-year historic rainfall data collected in Lumberton (Weatherunderground 2010, NOAA 2004). Groundwater data has been collected through October 1, 2010 and will continue to be collected for the remainder of the growing season (until November 14, 2010).

3.0 CONCLUSIONS

The Site achieved the defined (or targeted) success criteria, with saturation (free water) within one foot of the soil surface for a minimum of 12.5 percent (30 consecutive days) of the growing season at monitoring Gauge 2 while Gauge 1 was just shy of success criteria with inundation/saturation within 12 inches of the surface for 11.8 percent of the growing season. In addition, the reference gauge did not meet success criteria for the Year 3 (2010) monitoring season and rainfall was well-below normal for the month of April. A summary of groundwater gauge data is included in Table 11. Vegetation plots across the Site were above the required 320 stems per acre with an average of 793 planted tree stems per acre in the Third Monitoring Year (Year 2010) (Table 12). In addition, each individual plot was above success criteria with planted stems alone with the exception of plot 12; however, when including natural recruits/Character Tree Species this plot was well-above required densities with 647 stems per acre.

Table 11. Summary of Groundwater Gauge Results

| Gauge | Success Criteria Achieved/Max Consecutive Days During Growing Season (Percentage) | | | | |
|-------|--|-------------------------------|-------------------------------|---------------|---------------|
| | Year 1 (2008) | Year 2 (2009) | Year 3 (2010)* | Year 4 (2011) | Year 5 (2012) |
| 1 | Yes/68 days (28 percent) | Yes/53 days (21.5 percent) | No/29 days (11.8 percent) | | |
| 2 | Yes/35 days (23 percent) | Yes/55 days (22.4 percent) | Yes/35 days (14.2 percent) | | |
| Ref 1 | 34 days (14 percent) | 42 days (17.1 percent) | 13 days (5.3 percent) | | |

*Data was collected through October 1, 2010; data will continue to be collected for the remainder of the Year 3 (2010) growing season (through November 14, 2010).

APPENDIX A

VEGETATION DATA

1. Vegetation Survey Data Tables
2. Vegetation Monitoring Plot Photos

Report Prepared By Corri Faquin
Date Prepared 8/24/2010 10:27

database name RestorationSystems-2010-A.mdb
database location C:\Axiom\Business\CVS Database\2010
computer name CORRI
file size 55275520

DESCRIPTION OF WORKSHEETS IN THIS DOCUMENT-----

Metadata Description of database file, the report worksheets, and a summary of project(s) and project data.
Proj, planted Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
Proj, total stems Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
Plots List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
Vigor Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp Frequency distribution of vigor classes listed by species.
Damage List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
Damage by Spp Damage values tallied by type for each species.
Damage by Plot Damage values tallied by type for each plot.
Planted Stems by Plot and Spp A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.
All Stems by Plot and spp A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.

PROJECT SUMMARY-----

Project Code BrownMarsh
project Name Brown Marsh Restoration Site
Description Stream and Wetland Restoration Site in Robeson County
Sampled Plots 17

Living planted stems, excluding live stakes, per acre: Negative (red) numbers indicate the project failed to reach requirements in a particular year.

| Project Code | Project Name | River Basin | Year 3 |
|--------------|------------------------------|-------------|--------|
| BrownMarsh | Brown Marsh Restoration Site | Lumber | 792.71 |

Total stems, including planted stems of all kinds (including live stakes) and natural/volunteer stems:

| Project Code | Project Name | River Basin | Year 3 |
|--------------|------------------------------|-------------|-------------|
| BrownMarsh | Brown Marsh Restoration Site | Lumber | 1137.880808 |

APPENDIX B

GEOMORPHOLOGIC DATA

1. Tables B1-B5. Qualitative Visual Stability Assessment
2. Cross-section Plots and Tables
3. Longitudinal Profile Plots

Table B1. Visual Morphological Stability Assessment
Brown Marsh Reach 1 (557 linear feet)

| Feature Category | Metric (per As-built and reference baselines) | (# Stable) Number Performing as Intended | Total number | Number / feet in unstable state | % Perform in Stable Condition | Feature Perform. Mean or Total |
|--------------------|--|--|--------------|---------------------------------|-------------------------------|--------------------------------|
| A. Riffles | 1. Present | 12 | 12 | NA | 100% | 100% |
| | 2. Armor stable (e.g. no displacement)? | 12 | 12 | NA | 100% | |
| | 3. Facet grade appears stable? | 12 | 12 | NA | 100% | |
| | 4. Minimal evidence of embedding / fining? | 12 | 12 | NA | 100% | |
| | 5. Length appropriate? | 12 | 12 | NA | 100% | |
| B. Pools | 1. Present? (e.g. not subject to severe aggrad. Or migrat.?) | 12 | 12 | NA | 100% | 100% |
| | 2. Sufficiently deep (Max Pool D:Mean Bkf>1.6?) | 12 | 12 | NA | 100% | |
| | 3. Length appropriate? | 12 | 12 | NA | 100% | |
| C. Thalweg | 1. Upstream of meander bend (run/inflection) centering? | 12 | 12 | NA | 100% | 100% |
| | 2. Downstream of meander (glide/inflection) centering? | 12 | 12 | NA | 100% | |
| D. Meanders | 1. Outer bend in state of limited/controlled erosion? | 12 | 12 | NA | 100% | 100% |
| | 2. Of those eroding, # w/concomitant point bar formation? | NA | NA | 0 | 100% | |
| | 3. Apparent Rc within spec? | 12 | 12 | NA | 100% | |
| | 4. Sufficient floodplain access and relief? | 12 | 12 | NA | 100% | |
| E. Bed General | 1. General channel bed aggradation areas (bar formation) | NA | NA | 0 | 100% | 100% |
| | 2. Channel bed degradation – areas of increasing down-cutting or head cutting? | NA | NA | 0 | 100% | |
| F. Bank | 1. Actively eroding, wasting, or slumping bank | NA | NA | 0 | 100% | 100% |
| G. Vanes | 1. Free of back or arm scour? | NA | NA | NA | NA | NA |
| | 2. Height appropriate? | NA | NA | NA | NA | |
| | 3. Angle and geometry appear appropriate? | NA | NA | NA | NA | |
| | 4. Free of piping or other structural failures? | NA | NA | NA | NA | |
| H. Wads / Boulders | 1. Free of scour? | NA | NA | NA | NA | NA |
| | 2. Footing stable? | NA | NA | NA | NA | |

Table B2. Visual Morphological Stability Assessment
Brown Marsh Reach 2 (668 linear feet)

| Feature Category | Metric (per As-built and reference baselines) | (# Stable) Number Performing as Intended | Total number | Number / feet in unstable state | % Perform in Stable Condition | Feature Perform. Mean or Total |
|--------------------|--|--|--------------|---------------------------------|-------------------------------|--------------------------------|
| A. Riffles | 1. Present | 10 | 10 | NA | 100% | 100% |
| | 2. Armor stable (e.g. no displacement)? | 10 | 10 | NA | 100% | |
| | 3. Facet grade appears stable? | 10 | 10 | NA | 100% | |
| | 4. Minimal evidence of embedding / fining? | 10 | 10 | NA | 100% | |
| | 5. Length appropriate? | 10 | 10 | NA | 100% | |
| B. Pools | 1. Present? (e.g. not subject to severe aggrad. Or migrat.?) | 10 | 10 | NA | 100% | 100% |
| | 2. Sufficiently deep (Max Pool D:Mean Bkf>1.6?) | 10 | 10 | NA | 100% | |
