Stoney Creek Local Watershed Plan
Fact Sheet

Location:  Near Goldsboro, NC
River Basin:  Neuse
Cataloging Unit:  0302020
14-digit Hydrologic Units:  030202010010, 030202010020, 030202010021, 030202010022
County:  Wayne

Watershed Area:  29.8 square miles

Participants:  Local, State and Federal Government and Resource Agency Representatives, Ecosystem Enhancement Program (EEP) Representatives, Watershed Education for Communities and Local Officials (WECO) Facilitators

Watershed Assessment Contractor:  KCI Associates of NC

Project Overview

Stoney Creek in Wayne County was selected for this planning process for several reasons. It is considered impaired for its entire length due to poor biological communities and is cited on North Carolina’s 303(d) list due to nonpoint source pollution issues. Because it flows into the Neuse River which has well-documented nitrogen and phosphorus problems, it is classified as C-NSW by the NC Division of Water Quality (DWQ) meaning that these are nutrient sensitive waters. Stoney Creek was also one of 11 watersheds in the state chosen in 2001 for DWQ’s Watershed Assessment and Restoration Project (WARP), a detailed stressor study intended to identify specific causes of impairment. This study further identified straightening/channelization and sedimentation as important contributors to the stream’s poor biological condition. The upstream portion of the watershed is largely unincorporated agricultural and low-density residential land. The downstream portion of the watershed is predominantly urban including most of the City of Goldsboro. Seymour-Johnson Air Force Base overlaps the watershed boundary in the southeast. Much of the main stem and major tributaries in the watershed maintains significant forested buffers, partially due to the Mountains to the Sea Trail, a segment of which runs alongside the stream.
Project Schedule  Phases I through III of the plan are completed and the documents produced can be accessed at the links below.
